Job Market Paper

Do Urban Parks Promote Racial Diversity in Social Interactions? Evidence from New York City	2020
--	------

Abstract: While policymakers and urban planners often praise public space for promoting racial diversity, empirically it remains unclear whether these places play a role in creating diverse social environments for the city's residents. Focusing on parks in New York City as the exemplar of modern public space, I estimate the causal relationship between access to parks and individually experienced diversity. To do so, I introduce a measure of racial diversity that captures one's level of exposure to diverse others in places visited on a daily basis, utilizing a novel dataset featuring individual GPS tracking data for more than 60 thousand Twitter users in the New York metro area. My empirical strategy relies on obtaining a time-varying measure of access to parks that incorporates information about ongoing construction and repair works across the city. The results show that additional 10 acres of parkland within the 5km radius from home increase one's experienced diversity by about 1 p.p. (or 5% of the standard deviation). I also provide evidence to suggest that park accessibility affects the diversity of white and black residents differently: the effect appears to be more pronounced for whites than blacks, suggesting that parks in majority-white neighborhoods are able to attract a broader range of visitors compared to the local parks in black neighborhoods.

Other Working Papers

Do Local Businesses Benefit from Stadiums?
The Case of Major Professional Sports Leagues Arenas

(with *Dmitry Sedov*)
2020

Abstract: Stadiums cost hundreds of millions of dollars to build and are often subsidized by public sources. Subsidies are partly allocated in expectation that stadiums can improve the local economy by generating spending at local businesses. How large are such local spillover effects? We provide empirical evidence using data on the stadiums of major US sports leagues' teams. The dataset consists of stadium names and game dates from sports-reference.com matched with locations and daily foot-traffic of stadiums and nearby businesses from Safegraph. We estimate fixed effects and IV specifications that capture the spillover effects of stadium visit counts on visit counts to local businesses. Spillovers are heterogeneous across sports and business sectors. While baseball and football stadiums generate substantial traffic to Food & Accommodation and Retail Trade businesses, the null hypothesis of no spillovers cannot be rejected for basketball&hockey stadiums. We use the estimated effects to compare allocated subsidies with the benefits stadiums generated for the local economy.

Work and Teaching Experience

Research Assistant

For Prof. Christian Moser, Columbia University

2017-2018

My task was to perform data cleaning and geocoding for about 8 million raw address lines using Python and ArcGIS API. I was also responsible for providing summary reports and creating custom maps to visualize the data.

JOB MARKET PAPER

Effects of Exposure to Electoral Propaganda: Evidence from Spain (2020)

Abstract: Parties spend a substantial amount of their budget in advertising prior to elections but does this have any effect on voting behavior? This paper uses a novel dataset on street-level ad location of national-level elections within a city in Spain, where sorting of party ads to locations is randomized, to estimate the effects of ads on vote shares, how it depends on the socio-demographic characteristics of the electorate, as well as the effect of other parties' ads on vote shares and how it interacts with party platforms. I find that overall own ads have a positive effect on vote share, ads of parties with similar platforms act as complements to own ads, and ads of parties with more distant platforms act as substitutes to own ads.

Job Market Paper: The role of confidence over timing of investment information

Abstract: I present an investment environment wherein investors demand an asset based on perfectly informative signals, but face uncertainty about the timing of their information acquisition. I show that this reduces the demand and price for every period but that in the limit price as number of periods increases price converges to the true value of the asset. By introducing a concept of confidence over the time in which they receive a signal, I show that the impact of uncertainty can be exaggerated in either a negative or positive direction, with the limit price reflecting the true value of the asset depending on the type of confidence under consideration.

Working Papers:

Stackelberg oligopoly with positional uncertainty

Abstract: In a Stackelberg oligopoly setting, two firms set quantity without knowing whether they are the first or second in the market. I find that with a common prior, positional uncertainty always leads to a more competitive level of quantity. This finding is exacerbated when firms do not share a common prior and the sum of their prior beliefs of moving first exceeds unity. Even in the presence of a common prior and many identical firms as the number of firms increases, the equilibrium quantity in the presence of positional uncertainty can exceed that of perfect competition.

Social learning with limited histories

Abstract: I adapt the standard observational learning environment and introduce a limited history of observation. When agents can only observe the action of the previous agent, complete learning still occurs but with a loss of welfare. When a limited history is coupled with uncertainty over position in the queue of actors, welfare further drops - increasing in uncertainty - but complete learning still occurs in the limit. These results are illustrated with a canonical linear model but learning holds in a more general setting satisfying the usual social learning assumptions.

Job Market Paper

“Treatment Effects in Bunching Designs: The Hours Impact of the Federal Overtime Rule”

The Fair Labor Standards Act (FLSA) mandates overtime premium pay for most U.S. workers, yet a lack of clean variation in the rule has made it difficult to assess its impacts on the hours they work. I use bunching observed at 40 hours in administrative weekly paystubs to estimate this effect. To do so, I develop a general framework in which bunching at a kink point is informative about reduced form causal effects, nesting several existing approaches and abstracting them from underlying structural models. Under a non-parametric shape constraint on the distribution of hours and flexible assumptions on choice, a local average treatment effect among bunchers is partially identified. The bounds are informative in the overtime context and suggest that affected workers in the U.S. work an average of at least 25 minutes less as a result of the FLSA mandate, in weeks that they do work at least 40 hours. Overtime policy may thus have positive employment effects, though a scale effect could dominate.

Working Papers

“A Vector Monotonicity Assumption for Multiple Instruments” (September 2020)

When a researcher wishes to use multiple instrumental variables for a single binary treatment, the familiar LATE monotonicity assumption can become restrictive: it requires that all units share a common direction of response even when different instruments are shifted in opposing directions. What I call *vector monotonicity*, by contrast, simply restricts treatment status to be monotonic in each instrument separately. This is a natural assumption in many contexts, capturing the intuitive notion of “no defiers” for each instrument. I show that in a setting with a binary treatment and multiple discrete instruments, a class of causal parameters is point identified under vector monotonicity, including the average treatment effect among units that are responsive to any particular subset of the instruments. I propose a simple

“2SLS-like” estimator for the family of identified treatment effect parameters. An empirical application revisits the labor market returns to college education.

JOB MARKET PAPER

Sequential Sampling and Equilibrium (2020)

Abstract: I propose an equilibrium solution concept based on players sequentially sampling to resolve strategic uncertainty — uncertainty with respect to the distribution of gameplay of the opponents. Players optimally accumulate empirical information on their opponents' distribution of actions at a cost. Equilibrium imposes a consistency condition on the overall distribution of gameplay. The solution concept makes predictions on the joint distribution of players' choices, beliefs and response times, and generates stochastic choice through the randomness inherent to sampling, without relying on indifference or choice mistakes. It rationalizes well-known deviations of gameplay from Nash equilibrium as well as patterns in process data such as decision times.

Job Market Paper

“High-MPC Households and Emerging Market Business Cycles”

Micro data suggest that households in emerging economies exhibit substantially higher marginal propensity to consume (MPC) than those in developed economies. This paper evaluates the role of high-MPC households on the stylized patterns of emerging market business cycles. To this end, this paper makes the first attempt to study the emerging market business cycles through the lens of a heterogeneous-agent small open economy (HASOE) model. Specifically, I discipline the model using MPC estimates from the micro data and take the model to macro data through Bayesian estimation. When households are counterfactually replaced with those exhibiting U.S. MPCs, consumption volatility drops by 30 percent, and emerging economies’ stylized pattern that consumption is more volatile than output disappears. High-MPC households contribute to the consumption volatility through two main channels: strong consumption response to individual resource fluctuations and significant disruption in consumption smoothing when illiquid assets become more illiquid. The driving mechanisms of conventional theories such as consumption response to trend shocks or intertemporal substitution caused by interest rate variations do not drive the business cycles in my model because high-MPC households cannot accommodate them.

Working Papers

“MPCs and Liquidity Constraints in Emerging Economies”

For the first time in the literature, this paper estimates the marginal propensity to consume (MPC) out of transitory income shocks using micro data for an emerging economy. To this end, I employ a nationally representative Peruvian household survey. Two striking differences emerge when the Peruvian MPC estimates are compared with U.S. MPC estimates obtained by the same method. First, the mean MPC of Peruvian income deciles (0.632) is much higher than that of U.S. deciles (0.089). Second, within-country MPC heterogeneity over the deciles is substantially stronger in Peru. Patterns in the consumption growth of the deciles and the MPCs of unconstrained top income groups delineated by an MPC homogeneity test suggest that liquidity constraints are important for explaining both the higher mean MPC and the stronger MPC heterogeneity in Peru.

“Who Bears Aggregate Fluctuations in Emerging Economies?”

This paper assesses how rich and non-rich households share aggregate consumption and income fluctuations differently between a developed economy and an emerging economy. To this end, I apply the fluctuation decomposition method devised by Parker and Vissing-Jorgensen (2009) to the U.S. and Peruvian household surveys. The U.S. bottom 80% consumption group contributes to aggregate consumption fluctuations 0.8 times as much as it does to aggregate income fluctuations, while Peruvian bottom 80% consumption group contributes to aggregate consumption fluctuations 1.7 times more than it does to aggregate income fluctuations. This result suggests that non-rich households in emerging economies could be important contributors to the phenomenon of excess consumption volatility, the stylized pattern of emerging economies that consumption is more volatile than output. The existing theories for the excess consumption volatility do not square well with this finding because these theories involve mechanisms that non-rich households in emerging economies are less able to accommodate.

Pre-Doctoral Publication

(In Korean) **“The Value-Added and the Productivity of Korean Banking Industry,”** with Se-Jik Kim, *Economic Analysis* 21(3), 2015, 35-74.

This paper aims to evaluate the core ability of Korean banks to distinguish more productive firms from less productive ones and provide loans selectively to the former. To this end, we calculate the value-added of Korean banks from the distribution side, and then assess total factor productivity (TFP) of the banks using the financial statement data for the period 1991-2013. We find that the productivity of the Korean banking sector has not far grown from the level of the early 1990s. The banking sector productivity, which plummeted during the 1997 Korean financial crisis, rebounded in the mid-2000s but retreated again to its level of 1991 in recent years. We also discover that major declines in the Korean banking sector productivity can be largely attributed to tremendous losses from huge bad loans. These findings suggest that Korean banks may not have fully developed their capacity to select high-productivity firms and reduce bad loans for the last two decades.

JOB MARKET PAPER	<ul style="list-style-type: none">• "Access to Care in Equilibrium" (Job Market Paper) <p>Abstract: This paper studies access to care as an equilibrium outcome of a market without prices. I estimate an empirical matching model where patients match with physicians, using data from the Northern Ontario primary care market. In the model, the market is cleared by a non-price mechanism: the effort it takes to find a physician who is accepting patients. I find that access to care is lower in rural areas</p>

than urban or suburban areas. This is not caused by lower physician-to-population ratios in rural areas, but the distances patients must travel. Young adults in urban and suburban areas also face low access to care, caused by difficulties in finding physicians who are accepting patients. Two policies are analyzed. Alternative payment systems are found to increase access to care by incentivizing larger patient panels. Grants to attract physicians to areas with low access to care are found to be inefficient, because they are allocated according to imprecise measures of access to care.

RESEARCH PAPERS

Who Writes the Check to the Government Does Matter: Evidence from Firm-to-Firm Links (Job Market Paper)

This paper quantifies the behavioral response of firms to a reform to the collection of Value Added Tax (VAT). Combining administrative data on firm-to-firm links from Italy and a quasi-experimental design, I find that the reform had limited impact in improving compliance, yet it distorted firm operations and market outcomes along two main dimensions. First, business transactions affected by the reform are 2.5pp more likely to become inactive. Second, firms are not able to completely substitute these transactions with new ones. As a result, firms more exposed to the reform report lower business sales and a lower survival probability.

Importing Inequality: Migration, Mobility, and the Top 1 percent (joint with Arun Advani, Felix Koenig, and Andy Summers)

In this paper we study the contribution of migrants to the rise in UK top incomes. Using administrative data on the universe of UK taxpayers we show migrants are concentrated at the top of the income distribution, with migrants twice as prevalent in the top 0.1 percent as anywhere in the bottom 96 percent. These high incomes are predominantly from labour, rather than capital, and migrants are concentrated in only a handful of industries, predominantly finance. Almost all (85%) of the growth in the UK top 1% income share over the past 20 years can be attributed to migration.

JOB MARKET PAPER

Transport Infrastructure Improvements, Intra-City Migration, and Spatial Sorting: Evidence from a BRT system in Buenos Aires

How do improvements in the urban transport infrastructure affect spatial sorting between high- and low-skilled workers? In this paper, I leverage individual level panel data on the addresses of more than two million individuals in order to study the effect of the construction of a bus rapid transit system (BRT) in the city of Buenos Aires, Argentina, on the spatial reorganization of residents within the city. I then develop a dynamic quantitative spatial equilibrium model of the city in order to quantify the heterogeneous welfare effects of this BRT system, as well as to study the effect of different counterfactual scenarios on the spatial sorting of workers within the city. My findings suggest that the effects of increasing market access on the share of high-skilled residents is increasing in the initial high-skill share of the neighborhood. For census tracts in neighborhoods with the lowest share of high-skill workers, an increase in market access reduced the share of high-skilled workers living in those census tracts. However, for census tracts with an initially high share of high-skill workers, an increase in market access resulted in an increase in the high-skill share. I show that these spatially differentiated effects led to an increase in the spatial segregation between high and low-skilled residents in the city.

JOB MARKET PAPER

“Discrimination in the Venture Capital Industry: Evidence from Two Randomized Controlled Trials”, 2020

Abstract: This paper examines the presence of discrimination in early-stage investors using two randomized controlled trials with real venture capitalists mainly from the U.S. The first experiment invites real U.S. investors to evaluate multiple randomly generated startup profiles, which they know to be hypothetical, in order to be matched with high-quality startups from the collaborative incubators. Investors can also donate money to randomly displayed startup teams to show their anonymous support during the COVID-19 pandemic. The second experiment utilizes a new email technology which traces detailed information acquisition behaviors of global VC investors to hypothetical pitch emails with randomized startup’s information. I find three main results: (i) Investors are biased towards female, Asian and older founders of relatively low-quality startups while biased against female, Asian and older founders of relatively high-quality startups. (ii) The source of bias comes from implicit bias, statistical discrimination and taste-based reasons. (iii) I detect a temporary stronger bias against Asian founders during the COVID-19 outbreak, which started to fade since April 2020. I also develop a consistent decision-based heterogeneous effect estimator by using within-individual level randomization.

WORKING PAPER

“How Venture Capitalists Bet: Evidence from Two Randomized Controlled Trials”, 2020

Abstract: Understanding the importance of both human and non-human assets in the process of firms' early-stage financing is crucial to examining theories of the firm. However, it is empirically difficult to generate causal evidence due to data limitations and the lack of exogenous variations. This paper uses two randomized controlled trials with real venture capitalists mainly from the U.S. to identify multiple startup team characteristics and project characteristics that causally affect venture capitalists’

investment process and to compare their relative importance. I find that multiple team characteristics (i.e. founder's educational background and entrepreneurial experiences) and project characteristics (i.e. traction, business model, location, comparative advantages, etc.) causally affect investors' contact and investment interest by influencing their evaluation of startups' potential financial return, risk, and loyalty. Although project traction matters the most in my experimental setting, fundamentally it is the investors' belief in the startup's profitability that matters the most. I also find the traditional correspondence test method, to an extent, inappropriate in testing the significance of project characteristics in virtue of the different signal-to-noise ratio problems.

“ESG and Venture Capital Investment: Experimental Evidence”, 2020

Abstract: This paper examines the effect of ESG characteristics of startups on venture capitalists' investment interest by employing a randomized controlled method. I invite real U.S. investors to evaluate multiple randomly generated startup profiles, which they know to be hypothetical, in order to be matched with high-quality startups from the collaborative incubators. I find the following three main results: (i) Aiming for environmental and social impact causally lowers investors' expectation of the startup's future profitability rather than risk. Therefore, profit-driven investors are less likely to contact or invest in ESG-related startups. (ii) Profit-driven investors have a stronger implicit belief that ESG related startups would not seek for collaboration with them. (iii) There is a positive interaction effect between ESG characteristics and the founder's educational background, indicating that a high level of education helps improve investor's expectation of the ESG startup's profitability. Experimental results challenge the traditional thesis of “doing well by doing good” and support the recent findings that investors derive non-pecuniary utility from impact investing while sacrificing their financial returns.

“The Microstructure of U.S. Housing Market: Evidence from Millions of Bargaining Interactions”, 2020 with [Haaris Mateen](#), [Franklin Qian](#)

Abstract: We study patterns of behavior in the U.S. housing market bilateral bargaining situations using a rich new data set describing bid-level housing transaction behaviors occurring in over 150,000 listings from Redfin platform. We compare observed behavior to predictions from the large theoretical housing literature. Model testing outcomes show that existing housing micro-structure models do not adequately explain the under-reaction behaviors in sellers' estimates of the final sales price of the house. We also provide novel micro-level evidence describing how home buyers' characteristics affect their bargaining power and surplus allocation in these bilateral bargaining process in the housing market. These observations suggest that housing transaction behaviors, which are neither incorporated nor explained by existing theories, play an important role in the U.S. housing market.
