### Job Market Paper

"Macroeconomic Expectations and Cognitive Noise"

Economic agents face a vast amount of information about the macroeconomy. In this paper, I study how expectations are formed when the capacity to process information is constrained. Compared to the prior literature, I suppose that such constraints apply to information both external and internal to the mind of forecasters. I show that jointly considering these two constraints is important. Qualitatively, the proposed model accounts for the seemingly puzzling patterns emphasized in the literature. Quantitatively, it reveals that the existing literature is likely underestimating the magnitude of information constraints. Finally, I emphasize that economic agents' expectations can vary with a change in economic policy. I show that the conduct of monetary policy affects inflation expectations and how firmly they are anchored.

"Optimally Imprecise Memory and Biased Forecasts" (with Rava Azeredo da Silveira and Michael Woodford), NBER Working Paper No. 28075, Nov. 2020

- Revised and Resubmit, American Economic Review

We propose a model of optimal decision making subject to a memory constraint. The constraint is a limit on the complexity of memory measured using Shannon's mutual information, as in models of rational inattention; but our theory differs from that of Sims (2003) in not assuming costless memory of past cognitive states. We show that the model implies that both forecasts and actions will exhibit idiosyncratic random variation; that average beliefs will also differ from rational expectations beliefs, with a bias that fluctuates forever with a variance that does not fall to zero even in the long run; and that more recent news will be given disproportionate weight in forecasts. We solve the model under a variety of assumptions about the degree of persistence of the variable to be forecasted and the horizon over which it must be forecasted, and examine how the nature of forecast biases depends on these parameters. The model provides a simple explanation for a number of features of reported expectations in laboratory and field settings, notably the evidence of over-reaction in elicited forecasts documented by Afrouzi et al. (2020) and Bordalo et al. (2020a).

"The impact of TLTOR2 on the Italian credit market: some econometric evidence" (with Lucia Esposito and Davide Fantino), Bank of Italy Temi di discussione No. 1264, Feb. 2020

This work evaluates the impact of the second series of Targeted Longer-Term Refinancing Operations (TLTRO2) on credit market conditions for Italian firms. The estimates use a difference-in-differences approach on quarterly data, including term loans, interest rates, and bank and firm characteristics, between the start of 2015 and the end of 2017. The TLTRO2 had a positive impact on credit, encouraging lending to firms and reducing interest rates. The impact on the amount of credit was stronger for less risky firms, while that on interest rates was stronger for riskier ones. Smaller firms benefited more in terms of both loan amounts and interest rates.
