JOB MARKET PAPER

The Perceived Causes of Monetary Policy Surprises

[\[Latest version\]](#)

ABSTRACT. I estimate the macroeconomic effects of two critical aspects of Federal Reserve (Fed) communications: forward guidance regarding the path of interest rates and the provision of macroeconomic information. To estimate these effects, I identify two new series of shocks: monetary policy shocks and “information shocks.” I recover the shocks by estimating a model of how Fed announcements determine interest-rate and GDP expectations in high frequency, using a measure of GDP forecast revisions I construct from the text of newspaper articles. To identify the model, I use a discrete change in the Fed’s communication policy: the introduction of interest-rate forward guidance. I find that the identified monetary shock has macroeconomic effects that are consistent with New Keynesian models, and fall at the upper end of previous estimates. Additionally, information shocks resemble aggregate demand shocks and have effects of similar (absolute) magnitude as monetary shocks, which highlights the importance of the Fed’s role in providing macroeconomic information.

AWARDS, FELLOWSHIPS, AND GRANTS

AWARDS

2019 Vickrey Prize: best third year paper (Columbia University)
2018 Harriss Award: best second year paper (Columbia University)
2014 Firestone Medal: Excellence in Undergraduate Research (Stanford University)

FELLOWSHIPS

2021 Thomas J. Sargent Dissertation Fellow (Federal Reserve Bank of San Francisco)
2020–2022 Pre-doctoral Fellowship in Behavioral Macroeconomics (Alfred P. Sloan Foundation; NBER)
2017–2020 Program for Economic Research (Columbia University) Summer Fellow

2016–2022 Provost’s Diversity (2016–17), Dean’s (2016–2021), and Dissertation (2021–2022) Fellowships (Columbia University)

2018 Washington Center for Equitable Growth for “The Consequences of Extending Unemployment Benefits During Recessions” (\$41,087)

RESEARCH WORKING PAPER

2021 *A New Measure of Central Bank Transparency and Implications for the Effectiveness of Monetary Policy*
Revise and resubmit, *International Journal of Central Banking*

ABSTRACT. Transparency has been posited as a channel through which monetary policy is made more effective. This paper presents a new time-varying measure of the transparency of Federal Reserve deliberations, derived from the documents that the Fed uses to record and summarize each of its meetings. The measure—the similarity of the minutes and transcripts of each Federal Open Market Committee (FOMC) meeting—is largely, though not entirely, shaped by FOMC leadership. Monetary policy shocks have about a 40 percent larger effect on nominal and real interest rates when the prevailing level of transparency is high, suggesting an important role for transparency in determining the efficacy of monetary policy. These effects are primarily driven by transparency about monetary policy strategies conditional on the state of the economy. A simple model of FOMC announcements consistent with these results highlights that high transparency enhances monetary policy’s effectiveness by increasing the FOMC’s signaling ability, but diminishes the ability for policymakers to generate market surprises.

WORK IN PROGRESS

◇ *The Consequences of Extending Unemployment Benefits During Recessions*
with Andreas Mueller, Emi Nakamura, and Jón Steinsson

ABSTRACT. We estimate the effect of Unemployment Insurance (UI) benefit extensions on unemployment during recessions using newly constructed data on state-level legislation and extensions over the period 1976–2021. We exploit variation in UI “trigger rule” options, which give rise to large and persistent differences in UI benefit durations across states. We find that UI extensions initially raise the number of people collecting UI, but subsequently lead the total unemployment rate to decline. Our estimates are similar for the Great Recession and pre-Great Recession periods. These results suggest that Keynesian forces may ultimately overcome the effects of UI extensions on the incentives for workers to work and firms to post vacancies.

- ◇ *Rationally Confused: On the Aggregate Implications of Information Provision Policies*
with Hassan Afrouzi

ABSTRACT. Managing inflation expectations is an essential aspect of monetary policy. But how does communicating about inflation affect the decisions of price-setting firms? Cross-country evidence from randomized control trials provides a seemingly contradictory picture of how providing firms with news about inflation affects their decisions, where both contractionary and expansionary responses are observed. In this paper, we develop a rational inattention model that reconciles this evidence. In our model, firms' optimal information sets do not allow them to fully distinguish between supply and demand shocks. Accordingly, the model predicts that an exogenous increase in inflation expectations should be contractionary for economies where supply shocks are more volatile, and vice versa. We find supporting evidence for this mechanism by comparing output-inflation correlations in the data. These findings highlight the significant role that the broad economic environment can play in determining the effects of information provision policies.

- ◇ *Hysteresis in the U.S. Tariff Code: Origins and Implications*
with Lydia Cox

ABSTRACT. There is substantial variation in U.S. tariff rates within narrowly-defined goods. For example, tariff rates on handbags range from 5 to 16 percent, depending on their material. In this paper, we document the presence, historical origins, and consequences of this pattern. Using a newly-constructed dataset on legislated tariffs that covers all major trade agreements back to the 1930 Smoot-Hawley Act, we show that this within-good variation in tariffs originated in trade agreements made in the 1930 and 40s, and has persisted over time. Early trade agreements were made primarily with other high-income nations, and concessions were made on the specific varieties of goods that those countries produced. Instead, later GATT and WTO tariff negotiations had the broader focus of bringing down the average level of tariffs. One important consequence of this hysteresis in trade policy is that, today, tariffs are systematically higher on cheaper varieties of goods relative to their more expensive counterparts. We show that failing to take this heterogeneity into account substantially alters the distributional consequences of trade policy.

- ◇ *U.S. Legislated Tariffs since 1930*
with Lydia Cox

ABSTRACT. We present a newly-digitized dataset of legislated tariff rates in the United States that dates back to the Smoot-Hawley Tariff Act of 1930. The dataset contains all tariff rates from 1930–1946, all rates after every round of GATT negotiations through 1988, and all rates since 1989.

PUBLICATION

- 2015 *Using Occupation to Measure Intergenerational Mobility: Do Snapshots Matter?*
with Bhashkar Mazumder

The ANNALS of the American Academy of Political and Social Science. 657: 174-193

ABSTRACT. Scholarly investigations of intergenerational mobility typically focus on either the occupations of fathers and sons or their incomes. Using an identical sample of fathers and sons, we examine how estimates of intergenerational mobility in income and occupational prestige are affected by (1) measurement that uses long time averages and (2) varying the point in the life cycle when outcomes are measured. We find that intergenerational occupational mobility is overstated when using a single year of fathers' occupation compared to a 10-year average centered on mid-career. We also find that for both income and occupation, mobility estimates are largest when sons are in their mid-career, suggesting that this may be the ideal period in which to measure their status. Finally, we see differences in the pattern of estimates across the two types of measures: for income, estimates of intergenerational persistence are highest when fathers are in their mid-career; for occupation, estimates are much larger when fathers' occupations are accounted for late in their careers.

WORKING PAPERS	Residential Segregation and the Demand for Schooling Job Market Paper
-------------------	--

How do schools affect where families choose to live and does its effect contribute to residential segregation? I study these questions using unique administrative microdata from Auckland, New Zealand, an ethnically diverse – but segregated – city. I develop and estimate a dynamic model of residential choice where forward-looking families choose neighborhoods based on their children’s schools, local amenities, and moving costs. Previous studies typically estimate school quality valuation using a boundary discontinuity design. I apply this methodology here to derive both a reduced form and structural estimate for the valuation of school quality. The structural model estimates show that the valuation of school quality varies by the child’s school level and the family’s ethnicity; the reduced form approach cannot capture this heterogeneity. Moreover, I find that the reduced form estimates are aligned only with white families’ valuations of quality. The model estimates also show that families experience a high disutility from moving houses if it results in their child changing school. In counterfactuals, I show that residential segregation increases as the link between housing and schools weakens.

What Drives the Efficiency in Ridesharing Markets?

(with *Vinayak Iyer*)

Ridesharing platforms, who act as intermediaries in transport markets, improve upon traditional taxis along two key dimensions: surge pricing and centralized matching. We study how and why existing inefficiencies are solved by these two features and evaluate how alternate pricing and matching rules can improve outcomes. To this end, we develop a structural model of the ridesharing market with three components: (1) dynamically optimizing drivers who make entry, exit and search decisions; (2) stochastic demand; and (3) a matching technology. We evaluate the welfare effects of surge and matching separately. We also implement a simple change in the pricing rule by making it more flexible which is able to address both static and dynamic inefficiencies, thus generating large welfare gains for all agents. We conclude by drawing policy implications for improving the competitiveness of traditional taxis.

Cutoff from Support: The Effects of Losing Cash Welfare

(with *Lucas Husted*)

We evaluate a policy reform in Michigan, which unexpectedly removed over 10,000 families from TANF. Affected families increase their employment by 4 percentage points (20% relative to the control mean), but become poorer as they are unable to offset the loss of welfare benefits.

Drivers of Digital Attention: Evidence from a Social Media Experiment, [Draft](#)

Abstract: I study demand for social media services by conducting an experiment where I comprehensively monitor how participants spend time on digital services. I shut off access to Instagram or YouTube on their mobile phones and investigate how participants substitute their time allocations during and after the restrictions. During the restriction period I observe substitution towards a wide range of alternatives including across product categories and off digital devices and relate these findings to market definition in attention markets. Participants with the Instagram restriction had their average daily Instagram usage decline after the restrictions are lifted. Participants with the YouTube restriction spent more time on applications installed during the restriction period both during and after the restriction period. Motivated by these results, I estimate a discrete choice model of time usage with inertia and find that inertia explains a large portion of the usage on these applications. I apply the estimates to conduct merger evaluation between prominent social media applications using an Upward Pricing Pressure Test for attention markets. I find that inertia plays an important role in justifying blocking mergers between the largest and smallest applications, indicating that digital addiction issues are important from an antitrust perspective. Overall, my results highlight the usefulness of product unavailability experiments in analysis of mergers between digital goods.

JOB MARKET PAPER

Regulation Attenuation: Cross-Border Spillovers and Policies in the Opioid Epidemic

Abstract: Prescription drug monitoring programs (PDMPs)—online systems that health care providers and pharmacists can use to query patient prescription records—are one of

the most widely-used state tools in regulating the prescribing and dispensing of opioids. However, the staggered adoption of PDMPs over time has created opportunities for patients to evade monitoring by going to a state that does not have a PDMP. This paper evaluates how spillovers attributable to policy non-coordination between neighboring states impact the effectiveness of PDMPs. I find that after prescribers gain access to PDMPs, opioid volume and prescription opioid deaths decrease in counties with a PDMP that are insulated from opportunities for evasion. I find a similar effect in counties with a PDMP that are exposed to evasion. This suggests that exposure to evasion through proximity to non-PDMP areas does not significantly attenuate the policy effect. I also find evidence that opioid volume and prescription opioid deaths decrease in counties without a PDMP that are exposed to spillovers from counties with the policy. Illicit opioid deaths are not affected in any counties with a PDMP but decrease in counties without a PDMP that are exposed to spillovers. I discuss the potential mechanisms through which spillovers may operate.

PUBLICATIONS

What Can UWE Do for Economics?

with [Claudia Goldin](#). *AEA Papers and Proceedings*. 2018;108: 186-190.

Abstract: Men outnumber women as undergraduate economics majors by three to one nationwide. Even at the best research universities and liberal arts colleges men outnumber women by two to one or more. The Undergraduate Women in Economics Challenge began in 2015 as an RCT with 20 treatment schools and at least 30 control schools to evaluate whether better course information, mentoring, encouragement, career counseling, and more relevant instructional content could move the needle. Although the RCT is still in the field, results from several within treatment-school randomized trials demonstrate that uncomplicated and inexpensive interventions can substantially increase women in economics.

WORK IN PROGRESS

Nudging Providers to Curtail Dangerous Opioid Prescribing: A Trial to Investigate Mechanisms

with [Mireille Jacobson](#), [Weston Merrick](#), [David Powell](#), [Adam Sacarny](#), and [Ian Williamson](#)

Abstract: Nearly all states have Prescription Monitoring Programs (PMPs) to facilitate safer prescribing of opioids and other drugs, but research suggests that these systems only deliver benefits when health care professionals are required to use them. Even with PMP mandates in place, providers may be unaware of the dangers of co-prescribing opioids with benzodiazepines or gabapentinoids, which include increased risk of overdose and death. We conduct a randomized clinical trial of 12,000 prescribers in Minnesota whose patients had filled an opioid prescription and either a benzodiazepine or gabapentinoid prescription in the four months prior to randomization. Prescribers received an initial and follow-up letter highlighting either 1) a new PMP use requirement, 2) a list of up to five patients with opioid co-prescriptions, 3) both the PMP use requirement and the patient co-prescription list or 4) control (no letters). Using administrative data, we track effects of the letters on prescriptions and PMP usage and queries. Results will inform future work by state and local policymakers to make opioid prescribing safer.

Impact of New Curriculum for Introductory Economics Courses on Student Opinions and Economic Knowledge with [Rena Rosenberg](#) and [Sarah Thomas](#)

Abstract: Curriculum Open-access Resources for Economics (CORE) is an alternative curriculum to teach introductory economics. The goal of the CORE USA Project is to expand student reach and to inspire a more diverse student body to pursue economics long-term by making course content more relevant and accessible. We conduct two confidential surveys with students enrolled in spring 2020 introductory economics courses at Columbia University and Barnard College. The two surveys, conducted at the start and end of the semester, ask students about their reasons for enrolling in the course, their interest in the field of economics and career aspirations, and their opinions about markets and traits important for success as an economist. The surveys also assess their knowledge of economic concepts and data literacy. We compare responses for student enrolled in courses that use CORE to those of students enrolled in courses that follow a more traditional curriculum. We complement our quantitative research with qualitative findings from focus groups conducted in spring 2020 and spring 2021.

Income Shocks and Consumer Response: Evidence from the 2018-19 US Government Shutdown

Abstract: The US federal government shutdown for 35 days from December 2018 to January 2019, the longest shutdown in the country's history. The shutdown caused a disruption in the administration of several federal benefit programs, including the Supplemental Nutrition Assistance Program (SNAP). The disruption resulted in a positive liquidity shock to SNAP beneficiaries, who received some benefits earlier than scheduled. While providing slack in how beneficiaries could spend other income, the disruption potentially exacerbated the "end-of-cycle gap" that occurs when benefits run out before the end of the month. Using Nielsen Consumer Panel data, I study how consumption of SNAP-eligible goods responds to the positive liquidity shock in areas with low share vs. high share of SNAP beneficiaries.

Patient Cost Sharing and Prescription Drug Trends: Evidence from Japan

Abstract: This paper studies the impact of patient cost sharing on the number of drug prescriptions and on the overall costs of prescription drugs by exploiting a feature of the Japanese health care system, where an individual's coinsurance rate is determined primarily by their age. I contribute to the previous research by investigating heterogeneous effects due to patient sex and drug therapeutic class (two "essential" classes, cardiovascular and antibiotics, and two "non-essential" classes, vitamins and antihistamines). Using publicly available aggregate data, I find that for the whole sample of drugs, price elasticity of demand ranges from -0.42 to -0.86 , and price elasticity for medical spending ranges from -0.31 to -0.67 , depending on the model specification. These estimates stand in contrast to previous estimates of price elasticity of demand (-0.16 to -0.2) and spending (-0.2), suggesting that patients have higher elasticity for prescription drugs than for other medical services. I also find that there are no heterogeneous effects by sex over the whole sample of drugs, but there are notable differences by sex for certain therapeutic classes of drugs. Finally, the data suggests that Japanese patients are more likely to be prescribed brand-name medications, but patients on generics may be more price sensitive to changes in patient cost sharing. Research on the topic has implications for designing more targeted government policy that could reduce health care costs, but more work is needed to assess patient health outcomes.

Hospital Implementation of Work-Life Balance Programs and Nurse Stress, Work-Family Conflict, and Work Satisfaction in Ibaraki Prefecture

Abstract: The high nurse turnover rate is an acute issue for Japan's health care system. In the recent decades, the government has promoted the Child Care and Family Care Leave Law and the work-life balance (WLB) programs outlined in it as tools to alleviate workplace stress and retain workers. I conduct a cross-sectional study of hospitals and nurses in Ibaraki Prefecture to learn about the implementation of the WLB programs and factors associated with nurse stress and work satisfaction. I design and run two surveys: a survey of all hospitals in the prefecture and a follow-up survey of nurses at six of these hospitals. I do not find a strong association between the nurse turnover rate and WLB program implementation, WLB program use, or the prioritization of nurse WLB in the workplace. I do find that hospitals that place a higher priority on nurses' WLB are more likely to implement certain types of WLB programs and to report nurses using them. The nurse survey identifies correlated sources of stress for nurses. I also find that greater social support from supervisors and coworkers is strongly correlated with fewer workplace conflicts as well as lower scores on various stress measures.

FELLOWSHIPS, GRANTS & HONORS

2021-22	<i>Dissertation Fellowship</i> (Columbia University)
2020-21	<i>Wueller Teaching Award</i> , runner-up for best teaching assistant for undergraduate electives (Department of Economics, Columbia University)
2019-20	<i>Wueller Teaching Award</i> , best teaching assistant for undergraduate electives (Department of Economics, Columbia University)
2018-19	<i>Alison Hanson Jones Fellowship for Economics and History</i> (Graduate School of Arts and Sciences, Columbia University)
2018-19	<i>Wueller Teaching Award</i> , runner-up for best teaching assistant for principles of economics (Department of Economics, Columbia University)
2018	<i>Harriss Prize</i> , runner-up for best 2 nd year PhD paper (Department of Economics, Columbia University, for "Patient Cost Sharing and Prescription Drug Trends: Evidence from Japan")
2017-18	<i>Wueller Teaching Award</i> , best teaching assistant for principles of economics (Department of Economics, Columbia University)
2013-14	<i>Fulbright Research Fellowship</i> , University of Tsukuba
2013	<i>Phi Beta Kappa</i>
2013	<i>ACTR National Post-Secondary Russian Essay Contest</i> , Second Place (Heritage Learners, Level 3)
2012-13	<i>Tazuko Ajiro Monane Prize</i> (Harvard University, for outstanding achievement in the study of the Japanese language)
2009-10	<i>Harvard College Scholar</i>

Job Market Paper

Monopsony Power, Spatial Equilibrium, and Minimum Wages

Abstract: What role does labor market competitiveness play in determining the spatial distribution of economic activity? To answer this question, we develop a model of monopsony power in spatial equilibrium. Workers and firms are free to locate in any labor market, and the degree of market power a firm enjoys depends on the number of competing firms in its location. We show the model can rationalize concentrations of economic activity and the city-size wage premium through an endogenous labor market competitiveness channel. Using administrative data from Germany, we estimate that labor markets are more competitive in larger cities. Calibrating the model to match this reduced-form evidence, we find endogenous labor market competitiveness can explain 37% of the city-size wage premium and 14% of all agglomeration. We use our new framework to study the spatial and welfare implications of the 2015 German national minimum wage law. A traditional spatial model that ignores variation in monopsony power across space predicts large unemployment effects in smaller, lower-wage labor markets, contradicting the reduced-form

evidence on the law. Accounting for spatially-varying monopsony power, we find the enacted national law outperforms an alternative policy with a lower level of the minimum wage in East Germany, while a law that takes into account variation in productivity and competitiveness significantly outperforms both.

JOB MARKET PAPER

Canst Thou Beggar Thy Neighbour? Evidence From the 1930s

Does an exchange rate depreciation depress trading partners' output? I address this question through the lens of a classic episode: the currency devaluations of the 1930s. From 1931 to 1936, many of the biggest economies in the world successively left the gold standard or devalued, leading to a depreciation of their currency by more than 30% against gold. In theory, the effect is ambiguous for countries that did not devalue: expenditure switching can lower their output, but the monetary stimulus to demand might raise it. I use cross-sectional evidence to discipline the strength of these two mechanisms in a multi-country model. This evidence comes in two forms: (i) causal inference of the effect of devaluation on country-level variables, (ii) new product-level data to estimate parameters that are essential to discipline the response of trade — the international elasticity of substitution among foreign varieties, and the pass-through of the exchange rate to international prices. Contrary to the popular narrative in modern policy debates, I find that devaluation did not dramatically lower the output of trading partners in this context. The expenditure switching effect was mostly offset by the monetary stimulus to foreign demand.

WORKING PAPERS

When Did Growth Begin? New Estimates of Productivity Growth in England from 1250 to 1870, with Emi Nakamura and Jón Steinsson

We provide new estimates of the evolution of productivity in England from 1250 to 1870. Real wages over this period were heavily influenced by plague-induced swings in the population. We develop and implement a new methodology for estimating productivity that accounts for these Malthusian dynamics. In the early part of our sample, we find that productivity growth was zero. Productivity growth began in 1600—almost a century before the Glorious Revolution. Post-1600 productivity growth had two phases: an initial phase of modest growth of 4% per decade between 1600 and 1810, followed by a rapid acceleration at the time of the Industrial Revolution to 18% per decade. Our evidence helps distinguish between theories of why growth began. In particular, our findings support the idea that broad-based economic change preceded the bourgeois institutional reforms of 17th century England and may have contributed to causing them. We also estimate the strength of Malthusian population forces on real wages. We find that these forces were sufficiently weak to be easily overwhelmed by post-1800 productivity growth.

Supply or Demand: What Drives Fluctuations in the Bank Loan Market? with Carlo Altavilla and Miguel Boucinha

We propose a new methodology to identify aggregate demand and supply shocks in the bank loan market. We present a model of sticky bank-firm relationships, estimate its structural parameters in euro area credit register data, and infer aggregate shocks based on those estimates. To achieve credible identification, we leverage banks' exposure to various sectors' heterogeneous liquidity needs during the COVID-19 Pandemic. We find that developments in lending volumes following the pandemic were largely explained by demand shocks. Fluctuations in lending rates were instead mostly determined by bank-driven supply shocks and borrower risk. A by-product of our analysis is a structural interpretation of two-way fixed effects regressions in loan-level data: according to our framework, firm- and bank-time fixed effects only separate demand from supply under certain parametric assumptions. In the data, the conditions are satisfied for supply but not for demand: bank-time fixed effects identify true supply shocks up to a time constant, while firm-time fixed effects are contaminated by supply forces. Our methodology overcomes this limitation: we identify supply and demand shocks at the aggregate and individual levels.

Fiscal Adjustment to Monetary Shocks

How does the fiscal side of the US government react to monetary policy? I estimate the response of several fiscal variables to monetary shocks. Following an interest rate hike, tax receipts fall, outlays excluding interest payments are constant, and interest payments and debt increase. The fall in output that follows a monetary tightening — not legislated changes in marginal tax rates — drives the response of receipts. The fiscal authority therefore responds passively to monetary shocks, keeping spending constant and letting debt adjust to satisfy its budget constraint. In heterogeneous agent models, this scenario dampens output's response to monetary policy.

Job Market Paper

The Effect of Outsourcing on Remaining Workers, Rent Distribution, and Inequality

Firms can decide whether to produce some goods and services in-house or purchase them from the market. Increasingly, they are purchasing from the market—using subcontractors, temp agencies, and other outsourced labor. Low-wage workers' wages decline when they are outsourced, but little is known about how outsourcing affects remaining workers. If firms are rent sharing, outsourcing might increase remaining workers' earnings because there are more rents or fewer workers to share them with. This paper measures the impact of occupational layoff (OL) outsourcing, where firms outsource some occupations, on the earnings and separations of workers who remain employed by those firms. Using employer-employee data based on German social security records in a dynamic difference-in-differences design, outsourcing increases remaining workers' long-run earnings by 6% in a sample of 260 OL outsourcing events. Remainders are also more likely to stay at the outsourcing firm—outsourcing decreases the probability of remainders switching firms by 7.5 percentage points. Higher earnings and fewer separations are consistent with remainders receiving additional rents. Earnings gains are larger for workers in the bottom-half of the within-firm earnings distribution. Outsourcing only increases remainders' earnings in firms with collective bargaining agreements (CBAs). In firms with CBAs, outsourcing increases remainders' long-term earnings by 6%. In firms without CBAs, outsourcing lowers short-term earnings by 3%. The results are consistent with a model of wage setting where outsourcing firms with CBAs need to compensate remainders. When there is no CBA, firms do not compensate remainders and can lower their wages.

Analyzing the impact of outsourcing on within-firm and overall wage inequality, a typical outsourcing event in the sample lowers the within-firm Gini index by 2.5% as low-wage workers leave the firm and low-wage remainers are compensated. Using Recentered Influence Functions, increasing the share of workers part of an outsourcing event by 10 percentage points (from a baseline of 11.7%) increases the top of the earnings distribution by approximately 1-1.5%, and the overall Gini index by 1%. Remainders are relatively high-wage, and outsourcing increases their earnings. By not accounting for this effect, prior studies likely underestimate the total impact of outsourcing on earnings inequality in Germany.

Working Papers

“What’s in a Name? How Definitions of “Employee” Shape Worker-Firm Relationships” [joint with Elliott Ash. Supported by NSF Award Number 1949415]

This paper provides causal evidence on how changing the legal boundaries of employment—whether a worker is defined as a firm’s “employee” versus an outside contractor—affects labor market outcomes. We introduce a dataset of all U.S. Circuit Court cases making substantive employment determinations for the years 1990-2018 and link them to state- and occupation-level data on employment and earnings. Our difference-in-differences analysis reveals how employee definitions impact firm structure: when courts give workers additional legal rights by declaring them “employees”, low-wage workers are more likely to be outsourced. For occupations where effort is more easily monitored (e.g. janitors, guards), “is-employee” determinations increase outsourcing and reduce earnings. For occupations where effort cannot be monitored easily (e.g. doctors, scientists, engineers), employment declines and workers are more likely to be independent contractors.

“Why Choose Alternative Work Arrangements? The Effect of Labor Demand Shocks on AWAs in the U.S. Labor Market” [supported by the DOL Scholars Program]

Alternative work arrangements (AWAs) are employment contracts where workers have fewer legal protections relative to traditional employment. I analyze the effect of economic downturns on AWA prevalence using two negative labor demand shocks. In a framework with uncertainty and fixed labor costs, I find that negative labor demand shocks reduce the probability that workers are in AWAs. The largest declines in AWAs occur in industries most affected by the shocks. This result suggests that AWAs are more marginal employment contracts, and are mostly let go during downturns.

“Keep Going to School: The Effect of Social Promotion on Wage Response to Childhood Labor”

Research has shown that when wages increase, families are less likely to send their children to school. I explore whether the uncertainty about children’s success in school can explain part of this behavior. India’s “No Detention Policy”, enacted in 2010, required Social Promotion – automatic promotion regardless of test results – up to grade 8. I exploit pre-2010 variation in states with Social Promotion, and random wage shocks, to explore whether families are less likely to respond to wage shocks after Social Promotion is implemented. I find that without Social Promotion, higher wages increased dropout probability by 5%. With Social Promotion, higher wages decreased dropout probability by 1.1%, a sign switch and 80% decline in absolute effect. I find no effect on attendance, suggesting no intensive-margin response. These results illustrate that responses to wage shocks can depend on existing education policy, and that families internalize the likelihood of schooling success.

JOB MARKET PAPER

“A Dynamic Framework of School Choice: Effects of Middle Schools on High School Choice”

(with [Minseon Park](#))

Abstract: This paper explores the dynamic relationship of school choices made at different educational stages and its implication on racial segregation across schools. We use New York City public school choice data to ask: “How does the middle school a student attends affect her high school application and assignment?” We take two approaches to answer the question. First, we exploit quasi-random assignments to middle schools generated by the tie-breaking feature of the admissions system. We find causal evidence that students who attend high-achievement middle schools apply and are assigned to high-achievement high schools. Second, we develop and estimate a dynamic two-period model of school choice to decompose this effect and analyze the equilibrium consequences of counterfactual policies. In our setup, students applying to middle schools are aware that their choices may affect which high schools they eventually attend. Specifically, the middle schools that students attend can change how they rank high schools (the *application* channel) and how high schools rank their applications (the *priority* channel). We find that the *application* channel is quantitatively more important. Using the estimated model, we ask if an early affirmative action policy can address segregation in later stages. We find that a middle school-only affirmative action policy can alter students’ high school applications and thus assignments, contributing to desegregating high schools. This finding suggests that policy interventions for desegregation should start early.

WORKING PAPERS

“Leveraging Uncertainties to Infer Preferences: Robust Analysis of School Choice”

(with [Yeon-Koo Che](#) and [YingHua He](#))

draft available on request

Abstract: Recent evidence suggests that market participants make mistakes even in a strategically straightforward environment but seldom with significant payoff consequences. We explore the implications of such payoff-insignificant

mistakes for inferring students' preferences from school-choice data. Uncertainties arise from the use of lotteries or other sources in a typical school choice setting; they make certain mistakes more costly than others, thus making some preferences—those whose misrepresentation would be more costly and would thus be avoided by students—more reliably inferable than others. We propose a novel method of exploiting the structure of the uncertainties present in a matching environment to robustly infer student preferences under the Deferred-Acceptance mechanism. We then apply our methods to estimate student preferences through a Monte Carlo analysis capturing canonical school choice environment with single tie-breaking lotteries, and also to New York City's high school assignment data. We then evaluate the effects of an affirmative action policy on disadvantaged and non-disadvantaged students.

“Sorting, Commuting, and School Choice” (with [Minseon Park](#))

draft available on request

Abstract: This paper studies how families use two margins to get a seat in their preferred school under school choice - 1) sorting into neighborhoods (choosing where to live) and 2) commuting to school (choosing which school to apply to). Using New York City student-level data, we present the evidence of both margins. We find a sharp discontinuity at school district boundaries: middle school applicants residing on the side of the boundary with better schools are 5pp less likely to be eligible for Free or Reduced Lunch compared to their peers on the other side. At the same time, students take advantage of choice options actively with significant heterogeneity. 24% of Black students commute across school district boundaries while 12% of White students do. We build and estimate a structural model where a household chooses where to live and then which school to apply to. Location and schools are tied through commuting cost and geography-based priority. We extend the Expectation-Maximization algorithm with Sequential Maximization step (Arcidiacono and Jones, 2003) to estimate the model. We incorporate Boundary Discontinuity Design to deal with the endogeneity of school characteristics. We find that families sort into neighborhoods based on both observable/unobserved taste over school characteristics. There is large individual heterogeneity in terms of which neighborhood gives the higher expected utility. The decomposition exercise shows that heterogeneity in location demand explains 80 percent of the gap in the mean test score of schools Black and White students are assigned to. Both extending the bus service across school districts and adopting free borough-wide choice undo the gap by 10 percent.

“What Makes NYC Specialized High Schools So Special?”

draft available on request

Abstract: New York City (NYC) specialized high schools are highly selective and popular among students and parents. Nevertheless, the reason why those schools are so popular compared to non-specialized high schools has not been studied yet. This paper aims to answer the question in the context of academic performance, by studying the relationship among three factors: preferences of specialized high schools applicants, peer qualities and causal effectiveness of schools. First, a unique feature of NYC public high school admission system enables one to link preferences on specialized high schools and non-specialized high schools and hence to jointly estimate those using students' rank-ordered lists. Next, I estimate the value-added of schools that corrects endogenous selection following Abdulkadiroglu et al. (2017), and finally link them to the estimated preference in the first step. I preliminarily find the additional valuation that students and parents put on specialized high schools relative to non-specialized high schools is mostly related with higher peer quality at specialized high schools.

Job Market Paper

Cutoff from Support: The Effects of Losing Cash Welfare (with Motaz Al-Chanati)

Does removing families from welfare programs result in increased employment? Using detailed administrative data from Michigan, we study a policy reform in the state's TANF program that swiftly and unexpectedly removed over 10,000 families from welfare while quasi-randomly assigning time limits to over 30,000 remaining participants. Consistent with economic theory, removing families from welfare increases formal labor force participation by roughly 4 percentage points (20% over control group mean), with increases in annualized earnings of roughly \$500. We find that time limits – particularly for those further from their expiration – and sanctions due to program noncompliance yield similar results. However, despite this, the majority of families remain formally unemployed after welfare removal, and using quantile regressions we show that even the highest percentile wage gains fail to offset the loss in welfare benefits. Overall, our findings provide evidence that, contrary to their stated goals, welfare reform measures that either kick families off welfare or make welfare harder to access are likely to deepen poverty.

Working Papers

Welfare-to-Work Revisited: Was Jobs First Better?

Is it better to better match unemployed low-income individuals to the labor market, or first have them complete remedial coursework? I reexamine the original data from the GAIN experiment of the early 1990s, utilizing unexplored details about program intake that created quasi-random variation in treatment status within each treatment arm. Using a regression discontinuity design, I find support for the notion that among participants equally suited to either type of treatment, those induced directly into the labor force saw much larger increases in earnings relative to those who completed coursework. Effects are strongest along the extensive margin; neither type of programming differentially induces those already in the labor force to earn more. Finally, results grow in magnitude over time. This evidence leads to the conclusion that direct labor force strategies may be superior to remedial coursework for welfare participants who already have baseline cognitive skills.

The Impact of Natural Disasters on Human Capital (with R. Jisung Park and Isaac Oppen)

We show that natural disasters affect a region's aggregate human capital through at least four channels. In addition to causing out-migration, natural disasters reduce student achievement, lower high school graduation rates, and decrease post-secondary attendance. We estimate that disasters that cause at least \$500 in per-capita property damage reduce the net present value (NPV) of an affected county's human capital by an average of \$505 per person. These negative effects on human capital are not restricted to large disasters: less severe events – disasters with property damages of \$100-\$500 per capita – also cause significant and persistent reductions in student achievement and post-secondary attendance.

Journal Publications

Monetary Policy Uncertainty (with John Rogers and Bo Sun)

Journal of Monetary Economics, 2020. [Link](#)

We construct a new measure of uncertainty about Federal Reserve policy actions and their consequences, a monetary policy uncertainty (MPU) index. We evaluate the information content of our index and document the usefulness of our index in bridging periods of conventional and unconventional policy making. We also estimate the aggregate effects of shocks to MPU on output, credit spreads, and other variables. Finally, we investigate the transmission channels of MPU, finding that heightened MPU leads to protracted declines in firm investment through both real options and financial frictions channels.

Uncertainty, Currency Excess Returns, and Risk Reversals (with John Rogers and Bo Sun)

Journal of International Money and Finance, 88, 228-241. [Link](#)

In this paper we provide strong evidence that heightened uncertainty in the U.S. real economy or financial markets significantly raises excess returns to the currency carry trade. We posit that this works through the influence of uncertainty on global investors' risk preferences. Macro and financial uncertainty also lower foreign exchange risk reversals, an effect that is particularly strong for high interest rate portfolios. Our results are consistent with the idea that an increase in uncertainty regarding the U.S. economy or financial markets increases investors' risk aversion, which in turn drives up the expected returns and the cost of protection against crash risk in the FX market.

PAPERS	<p>What Drives the Efficiency in Ride Sharing Markets? Evidence from Austin, Texas (with Motaz al-Chanati) (Nominated for Best Paper, Econometric Society Meeting, Delhi School of Economics 2020)</p> <p><i>Ridesharing platforms, who act as intermediaries in transport markets, improve upon traditional taxis along two key dimensions: surge pricing and centralized matching. We study how and why existing inefficiencies are solved by these two features and evaluate how alternate pricing and matching rules can improve outcomes. To this end, we develop a structural model of the ridesharing market with three components: (1) dynamically optimizing drivers who make entry, exit and search decisions; (2) stochastic demand; and (3) a matching technology. We evaluate the welfare effects of surge and matching separately. We also implement a simple change in the pricing rule by making it more flexible which is able to address both static and dynamic inefficiencies, thus generating large welfare gains for all agents. We conclude by drawing policy implications for improving the competitiveness of traditional taxis.</i></p> <p>Informational Barriers to Market Access: Experimental Evidence from Liberian Firms (with Jonas Hjort and Golvine de Rochambeau), NBER WP No 27662</p> <p><i>Evidence suggests that many firms in poor countries stagnate because they cannot access growth-conducive markets. We hypothesize that overlooked informational barriers distort market access. To investigate, we gave a random subset of medium-sized Liberian firms vouchers for a week-long program that exclusively teaches “sellership”: how to sell to corporations, governments, and other large buyers. Firms that participate win three times as many formal contracts a year later. The impact is heterogeneous: informational sales barriers bind for about a quarter of firms. Three years post-training, these firms continue to win desirable contracts, are more likely to operate, and employ more workers.</i></p>	

Value of Public Transport and Landlord Market Power : Evidence from NYC (*with Lucas Husted*)

This paper studies how individuals across the income distribution value access to public transit and how this shapes the rental housing market. To study this question, we use the announced closure of the L train in NYC to study how rents were affected in the housing market and how the mobility decisions of individuals across the income distribution changed. We find that low-income households value the subway more than high-income households, while high-income households likely value other neighborhood amenities more. We show evidence of landlord market power and find that landlords give existing low-income households a higher discount on their rent to incentivize them to stay in the affected neighborhoods. From a transportation policy perspective, one must keep the dynamics of other neighborhood amenities in mind while evaluating whether intended beneficiaries benefit in the long run.

Transparency and Polarization of Political Speech : Evidence from Canada (*with William Labasi Samartino*)

This paper studies how MPs in the Canadian parliament modified their speeches post the television of parliamentary debates in 1977. Using NLP techniques on text data from the Hansard, we find that post the television of debates, speeches of MPs who were younger (in Parliament) become more polarized/distinct from their party manifesto relative to older (in Parliament) MPs. The effects are not persistent in the long run.

Job Market Paper

“Stable Outcomes and Information in Games: An Empirical Framework”

Abstract: Empirically, many strategic settings are characterized by stable outcomes in which players’ decisions are publicly observed, yet no player takes the opportunity to deviate. To analyze such situations in the presence of incomplete information, we build an empirical framework by introducing a novel solution concept that we call *Bayes stable equilibrium*. Our framework allows the researcher to be agnostic about players’ information and the equilibrium selection rule. The Bayes stable equilibrium identified set collapses to the pure strategy Nash equilibrium identified set under strong assumptions on players’ information. Furthermore, all else equal, it is weakly tighter than the Bayes correlated equilibrium identified set. We also propose computationally tractable approaches for estimation and inference. In an application, we study the strategic entry decisions of McDonald’s and Burger King in the US. Our results highlight the identifying power of informational assumptions and show that the Bayes stable equilibrium identified set can be substantially tighter than the Bayes correlated equilibrium identified set. In a counterfactual experiment, we examine the impact of increasing access to healthy food on the market structures in Mississippi food deserts.

Works in Progress

“Estimating Discrete Games of Complete Information: Bringing Logit Back in the Game”

Abstract: This paper proposes a fast and simple approach to estimating static discrete

games of complete information under pure strategy Nash equilibrium and no assumptions on the equilibrium selection rule. We characterize an identified set of parameters using a set of inequalities that are expressed in terms of closed-form multinomial logit probabilities. The key simplifications arise from using a subset of all identifying restrictions that are particularly easy to handle. Under standard assumptions, the identified set is convex. We show that the projections of the identified set can be obtained via convex programs. Numerical examples show that the identified set is tight. When applied to the entry game between Walmart and Kmart using Jia (2008)'s dataset, the projections of the identified set can be obtained in less than ten seconds.

“Estimating Dynamic Games with Unknown Information Structure”

Abstract: This paper studies identification and estimation of a class of dynamic games when the underlying information structure is unknown to the researcher. We introduce *Markov correlated equilibrium*, a dynamic analog of Bayes correlated equilibrium studied in Bergemann and Morris (2016), and show that the set of Markov correlated equilibria coincides with the set of Markov perfect equilibria that can arise when the players observe more information than assumed by the analyst. We leverage the informational robustness property of Markov correlated equilibria and propose an econometric approach for estimating dynamic games with weak assumptions on players' information. We also propose multiple computational strategies to deal with the non-convexities that arise in dynamic environment. As an empirical application, we apply the framework to study the dynamic entry competition by major coffee chains in the US.

JOB MARKET PAPER

Firm Dynamics and Innovation: Evidence from Decomposing Top Sales Shares, [PDF]

Abstract: What do changes in top sales shares signal about changes in firm dynamics? I use an accounting decomposition to identify two sources of top sales shares growth: (i) incumbent top firms grow bigger; (ii) new top firms replace old top firms. Over the 1950-2019 period, incumbent top firms contribute about 3.5 times as much as new top firms to the growth of the sales shares accrued to the top 0.01% firms in the US economy. Using the results from this empirical decomposition, I then build a model to estimate a firm dynamics process in which firms grow in response to own innovation shocks and shrink at the impact of creative destruction shocks. The existence of a channel through which own innovation can lead to higher top sales shares growth is supported by the data. My estimation reveals a surge in the rate of own innovation since 1980 and a decline in the rate of creative destruction over time.

OTHER WORKING PAPERS

Employment during the COVID-19 Pandemic: Collapse and Early Recovery with Tam Mai, [PDF]

Abstract: We use monthly Current Population Survey data to document employment changes during the COVID-19 pandemic at the occupation, industry, and metropolitan statistical area (MSA) levels. Over March-April 2020, jobs losses are larger for occupations with higher physical proximity or lower work-from-home feasibility, especially for lower-paying occupations. Non-essential industries also see greater declines in employment. Such occupational and industrial susceptibility to COVID-19 contributes to the variation in employment changes across MSAs: Employment shrinks more for MSAs with larger pre-crisis fractions of workers employed in occupations with higher infection risk. Over April-June 2020, occupations and industries that are hit harder recoup more jobs, but the recovery is only partial. Moreover, the gains are concentrated in lower-paying occupations and a few industries. Taken together, these abrupt changes in employment following the COVID-19 outbreak are unprecedented and potentially have long-term implications for occupational inequality and regional disparity.

Income Inequality and Mortgage Credit Allocation [\[PDF\]](#)

Abstract: This paper studies how income inequality at the Metropolitan Statistical Area (MSA) level affect mortgage credit allocation along the income distribution of households *within* MSAs. I find that MSA-level income inequality has heterogeneous effect on household-level mortgage debt accumulation. Two measures of inequality, the ratio of 95th-to-80th percentile (p_{95}/p_{80}) and the ratio of 80th-to-50th percentile (p_{80}/p_{50}) of household income, exhibit significant impact. With respect to credit approval along the income distribution, high p_{95}/p_{80} inequality works more in favor of low-income households while high p_{80}/p_{50} inequality benefits high-income households more.

JOB MARKET PAPER

Government Banks and Interventions in Credit Markets (with Gustavo Joaquim and Jose Renato Haas Ornelas)

We study a large scale intervention in the Brazilian banking sector, characterized by a sudden increase in the supply of credit provided by commercial government banks. Theoretically, the effects of this type of policy are ambiguous: the policy can be beneficial if credit is inefficiently low, or harmful if public banks finance riskier firms with unproductive projects. We use confidential credit registry data to document a series of empirical facts and test if the policy alleviates inefficient underprovision of credit. We show that while the policy leads to a reduction in private banks interest rates and to an increase in total credit, public banks experience worsening of loan default risk. In particular, government banks subsidize more levered firms, and loans to indebted firms explain differences in loan default between public and private banks. Moreover, neither the increase in total credit nor the reduction in interest rates of private banks has effects on GDP and employment growth. These findings suggest the policy did not ameliorate inefficiently low credit, but rather was associated with credit misallocation.

JOB MARKET PAPER

Coarse and Precise Information in Food Labeling

Public authorities and companies often adopt simple categorical labels to convey information and promote healthy, ethical, or energy-friendly behavior. These labels tend to be coarse and withdraw information. For example, food front-package labels often report low-fat but not the exact fat content. In this paper I study how labels with different precision affect choices: can precision become "too much" and impair choices?

In a preregistered online study conducted on a representative US sample, I manipulate the precision of front-package labels about foods' calorie content. Coarse labels generate higher levels of healthy choices compared to more detailed ones (-2% calories, -3% high-calorie products chosen), despite providing less information. Participants also prefer coarse labels.

Choices are at odds with the predictions of a Bayesian updating model, suggesting that subjects pay less attention to detailed information. A behavioral model with limited attention can capture the main results by introducing a tradeoff between level of detail and cognitive cost. Some information helps, but too much detail can be harm consumers, and lead to less healthy food choices.

JOB MARKET PAPER

“An Empire Lost: Spanish Industry and The Effect of Colonial Markets and Trade on Innovation”

Abstract: I study how accessing new (international) markets affects innovation direction. To do so, I use two historical experiments on the textile industry in Spain at the end of the 19th century. I provide causal evidence on how international trade's patterns enhanced biased technical improvements. Although each shock meant access to new markets to Spanish cotton textiles, their effect on innovation differed because demand characteristics were not the same. First, after Spain effectively forced their colonies to buy manufactured cotton goods in 1891, I document an increase in innovation destined to create cotton textiles. Second, after the Spanish-American war and the unexpected loss of these captive markets, I find a change inside the cotton industry towards weaving innovation. After the 1898 war, and with an already installed capacity, cotton industrialists entered and competed in international markets that demanded more sophisticated fabrics. Using novel archive data from a big cotton firm, I evaluate the mechanism that explains my results. I show that changes in intermediate goods relative prices explain the technology type that innovators developed. Finally, I show that these new incentives on innovation translated directly into adopting new mechanized tools in the sector. I find evidence of a rise in industrial technology due to an increase in mechanized cotton looms used in Spain after 1900.

Entry Barriers in Provider Markets: Evidence from Dialysis Certificate-of-need Programs
[job market paper]

Abstract. Can entry barriers in health care provider markets raise welfare? In the U.S., proponents of regulatory entry barriers called CON programs claim that they reduce waste by limiting “unnecessary” entry. I examine CON programs in the dialysis industry, where their effects on market structure, access, health, costs, and welfare are poorly

understood, and where patients are sensitive to access and quality. I combine quasi-experimental policy variation in low population areas with a structural model of patient preferences to find that marginal entrants improved access significantly, reduced hospitalization rates, and generated for patients the utility value of traveling 275-344 fewer miles per month; but there is evidence that they contributed even more to fixed costs. Using policy variation throughout North Carolina, I also find evidence that the NC dialysis CON program created a mechanism through which incumbents could block potential entrants by expanding in tandem with their local patient populations. Taken together, my findings suggest that stronger regulatory entry barriers in low population areas may raise total welfare at patients' expense—but they also amplify concerns that CON programs dampen competition statewide.

Estimating event studies when units experience multiple events

Abstract. An event study is a statistical framework used to identify the impact of an event over time using observational data. Researchers conducting event studies typically estimate average differences between treated units and untreated units before-and-after an event. So-called “no anticipation” and “parallel trends” assumptions are known to equilibrate such estimands with average treatment effects on the treated in settings where units experience one event at most. In this paper, I introduce a new event study framework to accommodate settings where units may experience one or more events. I introduce an estimator which consistently estimates average treatment effects on the treated of a single event under generalizations of the no anticipation and parallel trends assumptions. I also introduce a parallel pre-trends test which can be used to falsify these assumptions in the usual sense. Finally, I demonstrate in a series of Monte Carlo simulations that the estimator and parallel pre-trends test work well for a wide range of treatment effects, including dynamic, non-stationary, and history-dependent treatment effects.

JOB MARKET PAPER

Mentoring and Incentives

On the job training is one of the most effective ways of improving productivity especially in the public sector. Using data of the bureaucrats from the elite India Civil Services, I provide evidence that the human capital gained by the bureaucrats during their initial career varies significantly with the incentives of their mentor. I show that junior bureaucrats show better performance in the district training courses when their mentors are imperfectly observed by their supervisors. My findings can be rationalized in a framework where the mentor is a multi-tasking agent allocating time between mentoring and public service delivery. Mentors devote more effort to mentoring when their effort in district related tasks is imperfectly observed by their own supervisors. Exploiting a policy reform that was introduced to bring greater transparency in the performance evaluation system, I show that high powered incentives aimed to improve the bureaucratic performance of the mentors can end up reducing mentoring.

Job Market Paper

Competition and Errors in Breaking News

Abstract: We present a dynamic model of breaking news to understand the effect of competition on news accuracy. In our model, news firms are rewarded for reporting early, i.e. before their competitors, but also for making reports that are credible in the eyes of consumers. Errors occur when firms *fake*, reporting a story despite lacking evidence. Firms may alternatively choose to be *diligent*, only reporting a story if they have confirmed it is true. We establish both existence and uniqueness of an equilibrium. There are two different sources of faking in equilibrium: a lack of commitment and a preemptive motive engendered by competition. Even if diligence is optimal, firms are unable to commit to it. A firm can thus be tempted to fake, even in the absence of competition, in order to capitalize on both its favorable credibility and the inability of consumers to detect fake reports. Competition exacerbates faking because the reward from reporting early can give rise to a preemptive motive in equilibrium, thus incentivizing firms to report in haste. We also derive meaningful dynamics, finding that firms become gradually more credible over time whenever preemptive motives are at play. This increase in credibility endogenously mitigates the haste-inducing effects of preemption, and is thus crucial to balancing the firm's equilibrium incentives. Our equilibrium also exhibits a *copycat effect*: a report by one firm may trigger a surge in faking by others.

Working Papers

Reputation in News Media: Speed vs. Accuracy

Abstract: We study news firms' reporting behavior, including their propensity to misreport, when they are reputation-driven. In our model, a news firm (sender) dynamically learns about a state and reports to a consumer (receiver). Senders are concerned with their reputation at the end of the game, and must choose when to time their report. We find that in equilibrium, the sender fakes, i.e., report despite being ignorant of the state, with positive probability in every period. This faking in turn leads to a higher level of misreporting than if the sender were instead truthful. We further find the sender's reputations is endogenously rewarded for both speed and accuracy, and thus we provide a microfoundation to the speed-accuracy tradeoff in the news media setting. Finally, we consider the dynamics in the sender's strategy, finding that the sender becomes more truthful, and thus less prone to misreporting, as time passes.

Works in Progress

Dynamic Reputation-Driven Media Bias

Abstract: We study the dynamics of reputation-driven media bias. To this end, we present a dynamic model of reputation-driven media bias. A firm privately learns about an issue in increments and reports to a consumer with each new piece of information. With each new report, the consumer updates her beliefs about the firm's information quality, i.e., the firm's reputation. Firms are forward-looking and thus take into account both their immediate and future reputations when reporting. Nonetheless, we establish that equilibrium reporting behavior is identical for myopic and forward-looking firms. In equilibrium, firms bias their reports, and this bias is shown to be driven by two separate factors. First, firms can appear more reputable by appealing to a consumer's prior bias (the *prior effect*). Separately firms with reports that are more consistent across time are viewed more favorably (the *consistency effect*). The relative importance of the consistency effect grows over time as the firm accumulates a richer history of reports.

JOB MARKET PAPER

[The Costs and Benefits of Monitoring Providers: Evidence from Medicare Audits](#)

Abstract: This paper examines the extent to which government programs should monitor for wasteful expenditure when outsourcing to third parties, taking into account the costs and savings associated with monitoring. I use novel administrative data to study the largest Medicare monitoring program aimed at identifying unnecessary inpatient admissions and reclaiming payments for them. I exploit plausibly exogenous variation across hospitals and across patients, and find that the majority of savings are due to the deterrence of future admissions. I do not find evidence that the marginal patient denied admission is harmed, suggesting that hospitals fine-tune their response to target unnecessary care. But in doing so, they incur compliance costs and adopt technology specifically aimed at assessing the medical necessity of care. For every \$1,000 in savings to Medicare, hospitals incur \$216 in compliance costs. My welfare calculations imply that despite the costs, increasing monitoring improves welfare.

WORKING PAPERS

[Regulated Revenues and Hospital Behavior: Evidence from a Medicare Overhaul](#) *(submitted)*

with [Tal Gross](#), [Adam Sacarny](#), and [David Silver](#)

Abstract: We study a 2008 policy reform in which Medicare revised its hospital payment system to better reflect patients' severity of illness. We construct a simulated instrument that predicts a hospital's policy-induced change in reimbursement using pre-reform patients and post-reform rules. The reform led to large persistent changes in Medicare payment rates across hospitals. Hospitals that faced larger gains in Medicare reimbursement increased the volume of Medicare patients they treated. The estimates imply a volume elasticity of 1.2. To accommodate greater volume, hospitals increased nurse employment, but also lowered length of stay, with ambiguous effects on quality.

[Job Lock, Retirement, and Dependent Health Insurance: Evidence from the Affordable Care Act](#)

Abstract: The 2010 Affordable Care Act expanded health insurance coverage to dependents up to age 26, allowing some parents to add adult children to their employer-sponsored plans. I leverage this policy to understand the role adult children play in their parents' labor supply and consider a potential spillover of the dependent mandate policy to parents: did parents delay retirement to take advantage of the policy? I find that affected parents' retirement rate fell by 3.8 percentage points after policy enactment, causing them to delay retirement by 0.74 years on average. An estimated 290,000 parents delayed retirement in order to obtain coverage for their children.

[Free to Spend? The Effect of Decentralization on Local Governments](#)

with [Andrea Tulli](#)

Abstract: This paper considers whether decentralization of tax revenue to local governments affects their budgetary decisions. We study a 2012 Italian decentralization reform which (1) expanded municipalities' discretion in setting property tax rates, and (2) increased the share of the budget a municipality is responsible for raising through taxes. We exploit the unexpected nature and differential impact of the reform to document three findings. First, we use novel data on the tax rate the national government would have chosen in a centralized setting and compare it to the actual local tax rates municipalities chose, and find heterogeneity in how municipalities used their newfound discretion. Second, we find that municipalities responsible for raising a greater share of their budget raise more revenue and spend the additional resources on public services. Third, we show how political competition at the local level shapes the response. Municipalities with lower political competition spend less in public services, but more on administration and remuneration of public officials.

WORKS IN PROGRESS

Medical Necessity and the Cost and Quality of Healthcare

with [*Ashvin Gandhi*](#)

Research Question: How does requiring healthcare providers to demonstrate medical necessity change the cost and quality of care they provide?

What Determines Compliance with Hospital Pricing Transparency Laws?

with [*Ben Chartock*](#)

Research Question: Hospitals are required by law to disclose prices, yet many do not comply with this law -- what are the market-level and hospital-level determinants of compliance, and what does this imply about the usefulness of price transparency laws?

JOB MARKET PAPER

“Occupation Specificity and the Decline in the Aggregate Job Separation Rate”

Abstract: The long-run decline in the aggregate job separation rate in the U.S. has been documented in the literature. This paper analyzes the role of increasing occupation specificity, where human capital becomes less transferable across occupations, in the falling aggregate job separation rate. I do a shift-share decomposition of the decline in the aggregate job separation rate to find that it is accounted mostly by the within-occupation increase in specificity. Then I build a search-and-matching model where the increase in specificity within occupations reduces job separations. The model predicts 60% of the decline in the aggregate job separation rate. When occupations become more specific, human capital acquired from one occupation becomes less transferable to a different occupation, resulting in larger wage cuts for occupation switchers. Occupation switchers also have to undergo a longer period of occupation-specific training in their new occupation, during which they earn low wages. In the model, after the increase in occupation specificity, workers separate less to avoid switching occupations, accepting lower wages at their current job at the same level of productivity.

WORK IN PROGRESS

“Occupation Specificity, Endogenous Occupation Switching, and Unemployment Duration”

Abstract: It is documented in the literature that the average unemployment duration has increased in the U.S. This paper analyzes how the increase in occupation specificity, where human capital becomes less transferable across occupations, results in longer unemployment spells. I do a shift-share decomposition to find that the increase in the average unemployment duration is driven by the within-occupation increase in specificity. Then I build a search-and-matching model where the increase in specificity within occupations lengthens unemployment duration. The model predicts all of the increase in the average unemployment duration. In the model, the longer unemployment spells are due to the unemployed trained workers, whose human capital has become more specific to their previous occupation, choosing not to switch occupations. If they switch occupations, they could quickly end their unemployment spell. This would however come at the cost of larger wage cuts because their human capital has become less transferable to a different occupation. Occupation switchers would also have to earn these lower wages for a longer period of time until they become trained in their new occupation. Hence, despite a low probability of getting reemployed in the same occupation as before, previously trained workers increasingly choose not to switch occupations, which increases the average unemployment duration.

JOB MARKET PAPER

“Heat of the Moment? The Effect of Temperature on Police Racial Leniency”

Police officers often exercise substantial discretion when making highly consequential decisions, which can lead to unfair and arbitrary law enforcement. In this paper, I exploit daily ambient temperature as a source of transitory, high-frequency shocks and examine how it affects an officer's decision whether to discount a driver's speeding penalty in Florida. I find that a 1-standard-deviation increase in temperature lowers the driver's probability of receiving a lenient ticket by 2%. In addition, using traffic monitoring data and crash reports, I do not find evidence of decreased police effort or increased reckless driving on hot days. I show that the reduction in leniency is disproportionately borne by white drivers, who are less likely to get a discounted penalty from white officers as the temperature increases. In addition, I find that newly hired officers become less affected by temperature as they accumulate more experience on the job. For a potential mechanism, I find a negative effect of temperature on expressed sentiment using posts from an online police forum based in Florida, which suggests that the result could be due to increased officer hostility.
