| <b>Job Market<br/>Paper</b>  | “Happy Birthday, Go to Jail: Age-based Left-digit Bias in Criminal Sentencing”<br>< <a href="https://bit.ly/3aJH9o0">https://bit.ly/3aJH9o0</a> ><br><u>Abstract:</u> Judicial discretion allows judges to make nuanced decisions, taking into account details of legal cases that are not directly covered by law. However, judicial discretion can also expose behavioral biases and lead to irrational decision-making. I test for the existence of a particular behavioral bias: age-based left-digit bias. Specifically, I use a regression discontinuity design to test for changes in sentencing decisions occurring on an offender's 20th birthday using data on sentencing decisions from the state of Pennsylvania. I find that an offender sentenced just after his/her 20th birthday is 3.5 percentage points more likely to be sentenced to incarceration than an offender sentenced just before his/her 20th birthday. |  |                     |

**Other  
Research**

**“Racially-charged Events, Stress, and Birth Outcomes” *Working Paper***

Abstract: Police killings of Black Americans are increasingly being met with significant media coverage and public response, including civil unrest. Given the frequency with which these events occur, it is vital to understand both their direct and indirect impacts. Using national birth certificate data and an event study design, I test for the impact of high-profile police-involved killings of Black Americans on racial disparities in maternal stress levels and birth outcomes. I find a large, statistically significant, and persistent increase in gestational hypertension of Black mothers relative to White mothers, suggestive of an increase in the racial gap in maternal stress in response to these high-profile killings. I find little evidence of an accompanying effect on the racial gap in birth outcomes. However, many existing papers similarly find no impacts of maternal stress on birth outcomes while simultaneously finding significant impact on later-life outcomes, leaving room for additional future work based on my findings.

**“Informing or Signaling? Analyzing the Language of US Congresspersons in the Aftermath of Mass Shootings” *In Progress***

**“The Impact of Paid Maternity Leave: Evidence from Temporary Disability Insurance in Rhode Island,” with Ian Chin, Eric Chyn and Justine Hastings. *Unpublished.***

Abstract: This paper provides new evidence on the effects of paid maternity leave by exploiting income thresholds that affect program eligibility for Temporary Disability Insurance in Rhode Island. We use comprehensive administrative data and a regression discontinuity design to estimate impacts on a wide range of outcomes for mothers with low-earnings and their children. In the period surrounding childbirth, we find no significant effects on earnings or employment, and the point estimates suggest no reduction in short-run labor market attachment. We also find no detectable impacts on longer-run measures of economic self-sufficiency as measured by earnings, employment or participation in safety-net programs. To study effects of paid leave for high-earning mothers, we rely on machine learning techniques to optimally control for an unprecedented number of characteristics. We find some evidence of positive and significant impacts on a mother’s self-sufficiency for high-earning mothers. We caution that these estimates may be subject to selection bias. Finally, our analysis consistently finds no significant impacts on outcomes of children.

**“The Impact of Disability Insurance: Evidence from Rhode Island,” with Ian Chin, Eric Chyn and Justine Hastings. *Unpublished.***

Abstract: During the past decade, there has been a surge of support from U.S. policymakers for policies to provide paid sick leave. This paper sheds new light on the impact of paid sick leave using novel administrative data to measure economic and health outcomes. We study the case of Rhode Island where workers can access up to 30 weeks of paid leave for temporary illness or injury through the Temporary Disability Insurance (TDI) program. Using a regression discontinuity design based on eligibility thresholds for TDI, we find no significant impacts on measures of economic self-sufficiency such as subsequent earnings and social program participation, nor do we find detectable impacts on health expenditures. We do find positive and significant effects on a worker’s future TDI program applications. In addition, we find that coworkers are subsequently more likely to receive paid leave through TDI if an initial worker was just across the eligibility threshold. This pattern of results for the use of TDI paid sick leave suggests that receipt of benefits affects beliefs and knowledge about the program.

**“Leveraging Machine Learning for Optimal Policy: Evidence from Reemployment Services,” with Ian Chin, Eric Chyn and Justine Hastings. *Unpublished.***

Abstract: This paper uses novel administrative data from Rhode Island to estimate effects of re-employment services on recipients of Unemployment Insurance (UI) benefits. Our research design relies on random assignment that occurred as part of the Reemployment and Eligibility Assessment (REA) initiative. Individuals treated through REA were required to register for basic job-search services at their local career center. We find that this nudge for services reduced weeks spent on UI and total benefits claimed, while having no impact on employment or earnings. We use a causal forest algorithm to study treatment effect heterogeneity finding

that the average effects (particularly on labor market outcomes) masks important differences in responses across observable characteristics. Using these results, we propose an improved targeting system for optimal improvements in REA's target outcomes using predicted treatment effects from machine learning algorithms.

“Direct Interaction Advertising and Its Effects: A Study of reddit’s Ask Me Anything,”  
*Undergraduate Project*. <<http://bit.ly/2yddnGT>>

Abstract: Direct interaction advertising is my own term for a new form of advertising that has emerged in recent years along with the rise of social media. Using information provided by a number of instances of a reddit feature, “Ask Me Anything,” and information from Google Trends, I estimate the impact of this sort of advertising on interest both in the person doing the interaction and the product or service being advertised. There is a large positive effect on interest in the person and a smaller but significant effect on interest in the product or service. These effects do not seem to depend upon the reception of the AMA.

**Job Market Paper:** Too Much Information & The Death of Consensus

Abstract: Modern society is increasingly polarized, even on purely factual questions, despite greater access to information than ever. In a model of sequential social learning, I study the impact of motivated reasoning on information aggregation. This is a belief formation process in which agents trade-off accuracy against ideological convenience. I find that even Bayesian agents only learn in very highly connected networks, where agents have arbitrarily large neighborhoods asymptotically. This is driven by the fact that motivated agents sometimes reject information that can be inferred from their neighbors' actions when it refutes their desired beliefs. Observing any finite neighborhood, there is always some probability that all of an agent's neighbors will have disregarded information thus. Moreover, I establish that consensus, where all agents eventually choose the same action, is only possible with relatively uninformative private signals and low levels of motivated reasoning.

## **Working Paper:** Online Partisanship and Learning through Anonymous Speech

Abstract: The intense partisanship of social media is often remarked upon in modern political discourse, here I show that exaggerated partisanship is to be expected when non-partisan agents dislike to be caught making incorrect statements publicly. This is exacerbated by more limited information, and more extreme punishment for errors. I suggest the introduction of *partial* anonymous commenting as a solution.

## **Research and Work Experience:**

Research Assistant for Evan Sadler Academic Year 2022-23

Research Assistant for Navin Kartik Spring 2021

Research Assistant for Andrew Kosenko Fall 2021

I have acted as a Referee for the Journal of Economic Theory.

## JOB MARKET PAPER

### Doing Good in the Digital World

Though digital interactions between people have become more commonplace and sophisticated, behavior in digital settings remains underresearched. A distinctive feature of the digital world is the ability to calibrate or withhold one's identifier: a person can be identified by a string of letters, an avatar, their real name, or even nothing at all. That digital identifiers allow a person to mask their physical identity also makes it difficult to attribute digital actions to a physical person, even when the actions are observed. I embed these features in an experiment where subjects play a finitely repeated, linear public goods game. Treated subjects are identified in one of three ways—by their photograph, by a random number, or by a self-designed cartoon avatar—and their individual choices are revealed and either attributed to, or decoupled from, their identifier. In line with the previous literature, identifying subjects and increasing the precision of attribution increases contributions relative to a baseline condition without identifiers or revealed individual choices. Remarkably, however, the largest impact on behavior comes from having an identifier in the first place: for a given level of attribution, the experimental data suggest that being identified by a number or by an avatar is as powerful as being identified by one's photograph.

### Minority Turnout and Representation under Cumulative Voting: An Experiment

(with Alessandra Casella and Michelle Jiang)

*Games and Economic Behavior*, 2023

Under majoritarian election systems, securing the participation and representation of minorities remains an open problem, made salient in the US by its history of voter suppression. One remedy recommended by the courts is the adoption of Cumulative Voting (CV) in multi-member districts: each voter has as many votes as open positions but can cumulate votes on as few candidates as desired. Historical experiences are promising but also reflect episodes of minority activism. We present the results of a controlled lab experiment that isolates the role of the voting rule from other confounds. Although each voter is treated equally, theory predicts that CV should increase the minority's turnout relative to the majority and the minority's share of seats won. The experimental results strongly support both theoretical predictions.

## JOB MARKET PAPER

### “Leveraging Uncertainties to Infer Preferences: Robust Analysis of School Choice”

*under review*(with [Yeon-Koo Che](#) and [YingHua He](#))

**Abstract:** Inferring applicant preferences is fundamental in many analyses of school-choice data. Application mistakes make this task challenging. We propose a novel approach to deal with the mistakes in a deferred-acceptance matching environment. The key insight is that the uncertainties faced by applicants, e.g., tie-breaking lotteries, render some mistakes costly, allowing us to reliably infer relevant preferences. Our approach extracts all information on preferences robustly to payoff-insignificant mistakes. We apply it to school-choice data from Staten Island, NYC. Counterfactual analysis suggests that we underestimate the effects of proposed desegregation reforms when mistakes are not accounted for in preference inference and estimation.

Death Investigation Systems, Coroner Partisanship and Reported COVID-19 Mortality

**Abstract:** The politicization of the COVID-19 pandemic in the United States has raised questions about the integrity and accuracy of death reporting, particularly in jurisdictions with elected, partisan coroners. Using mortality data from the CDC and manually collected data on county-level death certification systems and coroner party affiliation where applicable, I examine the parallel systems of appointed medical examiners and elected coroners and investigate the effect of partisanship on reported COVID-19 deaths. Cross-sectional comparisons do not seem to suggest counties with coroners report fewer deaths than those with medical examiners, and difference-in-differences specifications reveal limited evidence of a statistically significant but not economically meaningful effect of partisanship on reported COVID death counts.

Lead Pipe Information and Housing Prices: An Analysis in Washington, DC

**Abstract:** In 2016, the Water and Sewer Authority of Washington, DC released an online map that contains information on lead service lines (LSLs) for all properties in the district. Using the release as a natural experiment, this paper estimates the effect of the new information on prices of properties with and without LSLs. Recent literature has found that housing lead reduction policies such as

remediation mandates have significant price effects. In DC, while the map's release was followed by a marked increase in requests for water lead tests, neither a difference-in-differences model nor a repeat sales model captures a significant divergence between housing prices of the two types of properties after the release, implying the housing market response to the information was limited.

#### Marriage Tax Subsidy and the Decision to Marry: Same-Sex Couples After *United States v. Windsor*

**Abstract:** The U.S. Supreme Court's ruling on *United States v. Windsor* in June 2013 compelled the federal government to recognize state-sanctioned same-sex marriages, including for tax purposes. The switch in the income tax filing status for same-sex couples meant that the marriage penalty or subsidy as a result of joint filing became a relevant factor that may enter couples' marriage decisions. I construct a sample of married and cohabiting same-sex couples in 2012 and 2014 from public-use data of the American Community Survey. Using a difference-in-differences methodology, I do not find evidence that same-sex couples who would earn a higher marriage subsidy became more likely to marry after the Supreme Court ruling.

## JOB MARKET PAPER

---

### Information Asymmetry in Job Search

(with Kai Zen)

*Abstract:* Standard models of rational job search assume agents know the distribution of offered wages when deciding which jobs to accept. We test if incorrect beliefs about wages affect real-world job search behavior in a field experiment with 1100 senior-year undergraduate students in the graduating Class of 2023 at the University of California, Berkeley. Partnering with the Career Center, we present personalized information graphics on school-and-major-specific salary distributions to students in the treatment group. We first document novel evidence that even prior to labor market entry, errors exist in wage beliefs – some students overestimate the available distribution, while others underestimate the available distribution. Post-treatment, we find that students treated with correct information update their beliefs towards the truth, and this is reflected in changes in reservation wages. At the end of the school year, we find that in comparison to the control group, students who increased their reservation wage after treatment had higher total and base salaries conditional on employment, a result significant at the 5% level. However, these same students had a lower, but imprecisely estimated likelihood of being employed by June post-graduation. An opposite but symmetric effect occurred for students who decreased their reservation wage. Our results are consistent with job search models where workers with more optimistic expectations wait longer to accept a job, but accept higher wages. We compare our experimental estimates to simulated moments from the model and find that the mean experimental effect is close to the model in magnitude under reasonable parameters. Our paper suggests an economically important role for subjective beliefs about labor market conditions and shows the effectiveness of a light-touch information intervention on employment and earnings for first-time job seekers.

1. **Minority Turnout and Representation under Cumulative Voting: An Experiment** (with Alessandra Casella and Jeffrey Guo). *Games and Economic Behavior* 141: 133-155, September 2023, <https://doi.org/10.1016/j.geb.2023.05.012>.

*Abstract:* Under majoritarian election systems, securing the participation and representation of minorities remains an open problem, made salient in the US by its history of voter suppression. One remedy recommended by the courts is the adoption of Cumulative Voting (CV) in multi-member districts: each voter has as many votes as open positions

but can cumulate votes on as few candidates as desired. Historical experiences are promising but also reflect episodes of minority activism. We present the results of a controlled lab experiment that isolates the role of the voting rule from other confounds. Although each voter is treated equally, theory predicts that CV should increase the minority's turnout relative to the majority and the minority's share of seats won. Our experimental results strongly support both theoretical predictions.

## WORK IN PROGRESS

---

### 1. Layoff Shocks and Job Mobility: A Study on Labor and Networks

*Abstract:* Traditional labor search models study worker productivity and wages, but do not account for how individual networks affect hiring. Recent literature suggests that networks play a larger role than previously expected; in particular, by cushioning negative labor shocks. The rationale is that having a larger network expands an individual worker's information set about outside options, leading to higher bargaining power and subsequent job mobility. However, prior literature does not account for why worker separations may be endogenous; more skilled workers may be more mobile. To address this, I combine LinkedIn data with mass layoffs data from the Worker Adjustment and Retraining Notification (WARN) Act. Using individuals' indirect links as an instrument for their networks in conjunction with mass layoffs from WARN as exogenous shocks, I test the impact of network size on future employment in the biotechnology sector, which has frequent mass layoffs due to clinical trial failure on the margin. In doing so, I seek to answer the following question: Do larger or higher-quality networks cushion against negative employment shocks? I find that connections help workers find jobs more quickly. Across a variety of specifications, each additional connection leads to approximately 10 fewer days of unemployment; for one standard deviation, this is 4.8 less months of unemployment.

### 2. Measuring the Returns to Diversity: State Variations in Affirmative Action

*Abstract:* Measuring the returns to diversity is traditionally difficult due to student selection into colleges. To account for selection, I use the exogenous measure of state-year variations in affirmative action bans as an instrument for changing cohort racial composition. This allows me to employ a two-stage difference-in-differences strategy to study the impact of diversity on post-school labor market outcomes. I find that given a 1 percentage point increase in the share of white enrollment (a decrease in diversity), instrumented via the affirmative action ban, mean cohort earnings increase by \$3000, while mean cohort employment decreases by 1 percentage point. The results persist across multiple years after graduation, and are robust across a variety of specifications and controls. My contribution to the literature is twofold. First, I examine post-school labor market outcomes such as earnings and employment, allowing me to analyze the long-term effects of increasing or decreasing diversity in student cohorts. Second, I build upon previous papers on the affirmative action ban by accounting for implementation of the percent plan, a policy which de facto partially reverses the enrollment effects of affirmative action bans. I show that this policy confounds enrollment results from previous papers.

*We study the equilibrium effects of subsidizing public services in the presence of vertically differentiated public and private suppliers. We evaluate one of India's largest welfare schemes, Janani Suraksha Yojana (JSY), which subsidized childbirth at public health institutions. JSY did not improve health outcomes despite a substantial increase in take-up of institutional care. We document three equilibrium responses that explain this policy failure. First, JSY led to a mismatch in patient risk across health facilities. High-risk mothers sorted out of the highest-quality care at private facilities and into lower-quality public facilities. Second, in response to congestion and deterioration of care at public hospitals, mothers with high socio-economic status sorted out of congested public facilities into more expensive private facilities. Third, private hospitals increased prices without improvements in healthcare quality in a specific subset of states, further crowding out high-risk and poor mothers. These findings point to the need for complementary public policies in addition to JSY, in particular, capacity improvements at public facilities and targeted vouchers for poor mothers to access healthcare at private facilities.*

**Electric stoves as a solution for indoor air pollution: Evidence from Rural India** (*with E. Somanathan, Marc Jeuland, Eshita Gupta, T.V. Ninan, Rachit Kamdar, Vidisha Chowdhury, Suvir Chandna, Michael Bergin, Karoline Barkjohn, Christina Norris, T. Robert Fetter, Subhrendu Pattanayak*)

*We collected minute-by-minute data on electricity availability, electric induction stove use, and kitchen and outdoor particulate pollution in a sample of rural Indian households for one year.*

*Using within household-month variation generated by unpredictable outages, we estimate the effects of electricity availability and electric induction stove use on kitchen PM2.5 concentration at each hour of the day. Electricity availability reduces kitchen PM2.5 by up to 50  $\mu\text{g}/\text{m}^3$ , which is between 10 and 20 percent of peak concentrations during cooking hours. Induction stove use instrumented by electricity availability reduces PM2.5 in kitchens by 200-450  $\mu\text{g}/\text{m}^3$  during cooking hours.*

## **Infrastructure resilience against environmental shocks and economic effects of transport disruptions: Evidence from India**

*(Vickrey award for best third year paper (runner-up), Columbia University )*

*I establish a causal link between the practice of crop-residue burning in India on disruptions in transport infrastructure using three independent causal inference techniques. I show that crop-residue burning gives rise to high volumes of particulate pollution, which combined with India's humid climate creates dense layers of smog. This smog not only affects peoples' health, but also affects India's entire transport infrastructure due to reduced visibility. As a result, rural workers' monthly savings decline as they switch to private modes of transport and buy more fuel.*

## **Can large scale conditional cash transfers resolve the fertility-sex ratio tradeoff? Evidence from India**

*Currently, there are at least 15 conditional cash transfer schemes in India that aim to correct persisting gender inequalities arising out of a preference for sons in Indian families. Despite huge financial resources being pumped into these schemes, there is a lack of field-level monitoring and useful redressal mechanisms which make their impact un-clear. I evaluate a conditional cash transfer (CCT) scheme called Ladli Laxmi Yojana in Madhya Pradesh, India. I find financial incentives aimed at the girl child increased average fertility by about 0.157 children per couple and improved sex-ratio by about 0.034 points pointing to the well known fertility-sex ratio trade-off. These effects are quite opposite to a similar CCT scheme in Haryana (Anukriti 2018) suggesting context/path dependence of these policies.*

## **POLICY WORK**

### **Determinants and Social Dividends of Digital Adoption** (with Mariano Moszoro and David Amaglobeli) (published as an IMF Working Paper)

*We identify key drivers of digital adoption, estimate fiscal costs to provide internet subsidies to households, and calculate social dividends from digital adoption. Using cross-country panel regressions and machine learning we find that digital infrastructure coverage, internet price, and usability are the most statistically robust predictors of internet use in the short-run. Based on estimates from a model of demand for internet we find that demand is most price responsive in low-income developing countries and almost unresponsive in advanced economies. We estimate that moving low-income and emerging market economies to the level of digital adoption in emerging and advanced economies, respectively, will require annual targeted subsidies of 1.8 and 0.05 percent of GDP, respectively. To aid with subsidy targeting, we use micro-data from over 150 countries and document a digital divide on gender, socio-economic status, and demographics. Finally, we estimate the monetized benefits of internet use on education quality as well as time spent doing unpaid work and labor force participation by gender. Our calculations suggest substantial aggregate and distributional gains from digital adoption. Moving low-income and emerging market economies to the level of digital adoption in emerging and advanced*

economies, respectively, improves education quality substantially and increases labor-force participation equivalent to 1.8 percent of GDP, largely driven by women.

## IN PROGRESS

### **Politics and public sector productivity** (*with Shreya Chandra*)

(*Analysis stage*)

*There has been a longstanding debate on the role of public sector firms in economic development. We conduct an empirical investigation of the classical theoretical claim that public sector firms are often captured by political interests (Shleifer and Vishny 1994). We study the case of Indian railways - one of the world's largest public sector firms. Our empirical strategy combines rich election data with a novel output-based measure of productivity - namely train delays. We have web-scraped travel times for millions of trips across the Indian railway network. Using closely contested elections as a source of plausibly random changes in political leaders across Indian constituencies, we plan to test whether (and how) politicians affect the operations of Indian railways.*

### **Household sorting and willingness to pay for spatially concentrated environmental dis-amenities: A case of Delhi's trash mountains** (*with Shreya Chandra*)

(*Data collection in progress*)

*Absent adequate urban planning, accelerated urbanization in developing countries can have severe consequences. Lack of waste management in India has resulted in huge trash mountains in major urban areas including Delhi. These overflowing landfill sites disproportionately affect the urban poor. Recent policy debates in Delhi have highlighted lack of public investment in cleaning up trash mountains. But how much should the government invest in clearing up trash mountains? This project aims to build a city-level willingness-to-pay measure using an urban spatial equilibrium model. Using granular data from the Indian census, we aim to calibrate an urban model for Delhi and evaluate welfare improvements from counterfactual removal of three major trash mountains. Monetized value of overall welfare gains will provide a measure of city-level willingness-to-pay to remove Delhi's trash mountains.*

## SCHOLARSHIPS AND GRANTS

| WORK IN<br>PROGRESS | <p><b>Cooperatives, Competition, and Compensation [Job Market Paper]</b></p> <p>How does the allocation of ownership and control rights within firms affect responses to economic shocks? To shed light on this question, I study the heterogeneous effects of a pro-competitive reform on cooperative manufacturing firms and their non-cooperative counterparts in India. The reform removed firm-size restrictions on the production of “reserved” items, increasing competition for incumbents in “de-reserved” product markets. Using a difference-in-differences approach, I find that supplier cooperatives (SCs), owned and controlled by producer-members who supply material inputs, are resilient to the shock in terms of total revenue and move away from the production of de-reserved items. SCs increase their share of income spent on materials relative to non-cooperatives in the same industries, with some evidence of downward adjustments in labor spending. These cooperatives are able to withstand competitive pressure from entrants while broadly catering to the interests of their membership. On the other hand, Worker cooperatives (WCs), owned and controlled by worker-members employed at the firm, face a sharp decline in revenue due to de-reservation, unlike non-cooperatives in the same industries. A potential channel behind these results is that WCs are less likely to respond by picking up items that are not directly affected by the reform. Spending on labor does not fall as much as revenue for WCs, which is in line with the immediate interests of membership, but adjustments to labor inputs vary significantly across employment categories. Taken together, these results offer insights on the relationship between firm organization and adjustments to resource allocation in response to shocks.</p> |

## **Equilibrium Effects of Incentivizing Public Services (*with Utkarsh Kumar*)**

We study the equilibrium effects of subsidizing public services in the presence of vertically differentiated public and private suppliers. We evaluate one of India’s largest welfare schemes, Janani Suraksha Yojana (JSY), which subsidized childbirth at public health institutions. JSY did not improve health outcomes despite a substantial increase in take-up of institutional care. We document three equilibrium responses that explain this policy failure. First, JSY led to a mismatch in patient risk across health facilities. High-risk mothers sorted out of the highest-quality care at private facilities and into lower-quality public facilities. Second, in response to congestion and deterioration of care at public hospitals, only mothers with high socio-economic status sorted out of congested public facilities into more expensive private facilities. Third, private hospitals increased prices without improvements in healthcare quality in a specific subset of states, further crowding out high-risk and poor mothers. These findings point to the need for complementary public policies in addition to JSY, in particular, capacity improvements at public facilities and targeted vouchers for poor mothers to access healthcare at private facilities.

**Complementarity and Substitution in Import Tax Evasion** (*with Michael Best, Nada Eissa, Joseph Okello, Jakob Rauschendorfer, and Sandra Sequeira*)

Combating the evasion of taxes on imports is an important strategy for improving domestic revenue mobilization in low-income countries. Previous work has relied on constructing “mirror-trade” gaps to identify tariff evasion through the underreporting of import values at customs. Our project extends this analysis to the Ugandan context and uses administrative data to identify another, potentially complementary, channel for evasion by importers: minimizing tax liability by overclaiming VAT paid on imports when filing VAT returns. We study the relationship between tax rates and these margins of evasion, providing rich detail on strategic behavior by importers and augmenting the analysis with data from corporate income tax (CIT) returns.

**Withholding Taxes: Implications for Services Trade, Revenue, and Equity** (*with Alexander Klemm and Li Liu*)

Withholding taxes (WHTs) have featured prominently in the ongoing reforms of international tax architecture, especially as part of the 2-Pillar Inclusive Framework agreement on Base Erosion and Profit Shifting and in the United Nations model tax convention. The policy rationale is to preserve some taxation rights in the source country given their straightforward application, which is particularly important for low-income countries in the absence of more effective rules. Notwithstanding the increasing policy focus it has received, there is surprisingly little research that looks directly at the economic effects of WHT— particularly in developing countries. We build a simple model of firms, with economic activities in one country and affiliates in others, making reporting decisions based on the burden of WHT. To test the predictions of this model using newly collected data on treaty and non-treaty rates for an expansive set of countries. We also estimate the implications of WHT on: (1) international trade in services, considering likely substitution effects across various forms of base-eroding payments and resident countries, (2) revenue collection and inequality, and (3) multinational investment.

## JOB MARKET PAPER

---

### Organized Crime, Local Politicians, and State Capacity

*Abstract:* This paper investigates the effects of successful assassinations of mayors on the capacity of local governments. By leveraging the randomness in the outcomes of assassination attempts against mayors in Mexico in 2002-21, I find that the fiscal and personnel capacities of municipal governments that lose their mayors deteriorate. Municipal tax collection decreases by 29%. The share of public expenditure on construction projects increases by 6.3 percentage points at the expense of other primary services. Municipal workers in their 30s and 40s leave the position. The back-of-the-envelope calculation shows that wages should increase by 13% to retain them after assassinations. Organized criminal groups take advantage of the vacuum of power by increasing their presence in municipalities with successful assassinations. The results are not explained by non-political violence, levels of economic activities, or changes in population. The results speak to the significance of leaders in maintaining fiscal capacity and retaining capable personnel in the workforce even in a violent environment.

## WORKING PAPERS

---

### Childbirth Effects of the 2004 Indian Ocean Tsunami (with Elizabeth Kayoon Hur)

*Abstract:* This paper evaluates the effect of in-utero exposure to the 2004 Indian Ocean Tsunami on short-term childbirth outcomes in Indonesia. We exploit variation in damage intensities across communities and the timing of exposure to identify causal links between in-utero exposure and birth outcomes. We find that the probability of successful pregnancies drops by 5.9 pp, while miscarriages increase by 5.5 pp in our preferred specification. However, this does not vary by intensity of exposure across communities. Household expenditures on health increased after the event, possibly contributing to reduced negative effects after the disaster. Our results suggest the importance of considering fetal loss for similar studies in developing countries and highlight that facilitating household investment in health through various policies may mitigate negative birth effects in the aftermath of natural disasters.

## Remittance and the Tax Structures in Developing Countries

*Abstract:* Despite the increasing flow of remittances in volume and proportion, particularly among developing countries, their role in determining the state's capacity to collect taxes has received little attention. This paper explores the link between remittances and various tax revenue categories using country-level data. Two-way panel regressions suggest that a 1%p increase in the inflow of remittances explains a 0.12%p rise in consumption tax revenues. The same estimate derived from IV methods proxying for migrant network strength and openness of borders increases to 0.9%p. Decomposing this result reveals that the increase in household consumption expenditure explains all of the statistical association, not the efficient tax-collecting mechanism such as VAT. Subsample regressions by income category suggest that the association between remittances and consumption tax revenue is stronger in countries with lower income.

## EDUCATION

**Columbia University**, Ph.D. Candidate, Economics, GPA 3.76/4

**(Expected) Dec 2023**

- Fields: Industrial Organization and Finance
- Acceptance rate ~3.5%; Dean's Fellow GSAS (\$400K); Dissertation Fellowship (\$36K)

**Institute for Advanced Studies, TU Wien (Austria)**, MSc, Economics, GPA: 95/100

**Jul 2016**

- Coursework: Game Theory, Quantitative Finance, Econometrics, Statistics, Mathematics
- Accepted as one of 8 students in the cohort; Scholarship (\$21K); Scholarship of the Serbian Ministry (\$12K)

**Faculty of Economics, University of Belgrade (Serbia)**, BSc, Economics, GPA: 9.83/10

**Jul 2014**

- Coursework: Microeconomics, Quantitative Finance, Probability Theory, Statistics, Mathematics
- Best student of the academic year 2013/14 at Faculty of Economics (out of ~1,250 students)

## RESEARCH

### **Interventions in Credit Markets and Effects on Economics Activity: Evidence from Brazil**

Looking at Brazilian bank branch-level data, I examine effects of the government policy from March 2012, intended to increase credit supply through public banks, on competition in the banking sector and economic activity. I find that the policy was successful in increasing overall credit supply as increased lending of public banks did not crowd-out private lending. On the other hand, there is no evidence of significant client-switching between private and public banks. However, the effects of the policy on economic activity were very limited and even negligible. I conducted a series of robustness checks to further examine this puzzling result. I find evidence that increased lending led to significant increases in deposits, suggesting that loans were taken at the moment of high availability of funds and saved for future use.

### **Television Introduction and Agricultural Production**

I assess the effects that improved information has on agricultural activity in the U.S. I use the introduction of television as proxy for improved information and argue that this happens through the channel of clearer communication of weather information. Using the difference-in-difference method, I estimate a significant positive effect of television introduction on crop yields.

## KEY PROFESSIONAL EXPERIENCE

**Ph.D. Student Researcher, Columbia University, Department of Economics**

**Sep 2016 - present**

- Developing and executing 5 individual and 2 joint research projects
- Interviewed industry professionals (managing directors, head of marketing) gaining insight into industry dynamics
- Performed extensive statistical and econometric analysis using R, MATLAB, and STATA (econometrics: cross-sectional and panel data analysis, quasi-experimental methods for estimating treatment effects, structural estimation)
- Collaborated with 15 peers completing 20+ joint class projects, each with top grades
- Presented work at ~10 seminars to groups of 15+ professors and peers

**Consultant, DT mapping**

**Dec 2021 – Jun 2023**

- Advising CEO of a geodetic data processing startup on a voluntary basis
- Devised and helped implement financial planning that is securing business investment capital of ~\$15K/year leading to growth from 5 people in 2021 to 20 people at the beginning of 2023
- Prepared critical facts, figures, and presentations for ~10 meetings with 3 clients leading to a ~25% average increase in hourly rates charged to clients

**Instructor & Teaching Assistant, Columbia University**

**Sep 2017 – Jun 2023**

- Taught 5 courses in economics to ~100 students total, creating 70+ presentations, exams, 20+ problem sets
- Assigned tasks to 5 teaching assistants and supervised their work
- Assisted in teaching one graduate course (36 students), and 8 undergraduate courses (~250 students)

### KEY LEADERSHIP EXPERIENCE

#### ***Founder and Coordinator, Volunteer Tutor Program “We are with you” (Serbia)***

**Mar 2020 – Jun 2020**

- Founded a nation-wide tutoring program with ~250 college students helping ~200 elementary and high school students transition to online learning
- Selected and managed a multidisciplinary team of 4 people to ensure continuous running of the program
- Built partnerships with ~20 colleges across Serbia and communicated with ~10 media outlets and ~15 professional organizations, establishing support, credibility, and recognition for the program

### ADDITIONAL EXPERIENCE

- Participated in **2023 Penn Healthcare Case Competition** as a part of a multidisciplinary team

**Oct 2023**

- **Referee** at Young Economist Symposium (reviewed 9 papers; participated in selecting top paper to be presented at the conference)

**Jun 2018 – Jul 2020**

- **Tutor** for 7 graduate and ~15 undergraduate students in economics, finance, math, stats

**Sep 2018 – present**

- **Grader** for 10 graduate level courses (~45 students on average)

**Sep 2018 – May 2023**

### INTERESTS

- Running (Belgrade half-marathon); Playing board games; Moviemaking (director of the Ph.D. skit video, led and coordinated ~30 people); Winemaking and wine-tasting

## JOB MARKET PAPER

### Attention Allocation and the Factor Structure of Forecasts

I explore how forecaster attention is reflected at the lower-dimensional factor representation of multivariate forecast data. When information is costly to acquire, forecasters may pay more attention to some sources of information and ignore others. How much attention they pay will determine the strength of the forecast correlation (factor) structure. Using a factor model representation, I show that a forecast made by a rationally inattentive agent will include an extra shrinkage and thresholding "attention matrix" relative to a full information benchmark, and propose an econometric procedure to estimate it. I show that the mapping from theoretical attention allocation to factor model representation is valid for a broad class of information cost functions. Differences in the degree of forecaster attentiveness can explain observed differences in empirical shrinkage in professional macroeconomic forecasts relative to a consensus benchmark. Better-performing forecasters have higher measured attention (lower shrinkage), than their poorly-performing peers. Measured forecaster attention to multiple dimensions of the information space can largely be captured by a single scalar cost parameter.

## PUBLICATIONS

### Constructing High Frequency Economic Indicators by Imputation (with Serena Ng)

*Forthcoming, Econometrics Journal*

Monthly and weekly economic indicators are often taken to be the largest common factor estimated from high and low frequency data, either separately or jointly. To incorporate mixed frequency information without directly modeling them, we target a low frequency diffusion index that is already available, and treat high frequency values as missing. We impute these values using multiple factors estimated from the high frequency data. In the empirical examples considered, static matrix completion that does not account for serial correlation in the idiosyncratic errors yields imprecise estimates of the missing values irrespective of how the factors are estimated. Single equation and systems-based dynamic procedures that account for serial correlation yield

imputed values that are closer to the observed low frequency ones. This is the case in the counterfactual exercise that imputes the monthly values of consumer sentiment series before 1978 when the data was released only on a quarterly basis. This is also the case for a weekly version of the CFNAI index of economic activity that is imputed using season-ally unadjusted data. The imputed series reveals episodes of increased variability of weekly economic information that are masked by the monthly data, notably around the 2014-15 collapse in oil prices.

### JOB MARKET PAPER

**Living up to Analyst Expectations: A Quantitative Analysis of Corporate Short-Termism.** *Draft coming soon.*

Do managers prioritize short-term gains over the long-term health of their companies? I explore this question by examining how external analyst forecasts causally influence managerial decisions around earnings. I measure the change in the composition of analyst ‘fixed effects’ induced by brokerage mergers, and use this as a source of exogenous variation in consensus forecasts. I find that firm-level earnings respond to sell-side analyst forecasts in a one-to-one fashion. I find that this earnings response is driven by accruals, consistent with earnings management on the part of short-termist managers. To estimate the cost of this short-termism, I develop a simple model that: (i) rationalizes forecast-dependent earnings management, and (ii) provides a framework for structurally estimating short-termism in the data. I find that short-termism is a significant feature of the US public firm environment, and very costly: moving to no short-termism is associated with an increase in the average earnings-per-share of 0.47 standard deviations.

### PUBLICATIONS

**Corporate Social Responsibility**, with [Harrison Hong](#). *Forthcoming at Annual Review of Financial Economics*

Is shareholder interest in corporate social responsibility driven by pecuniary motives (abnormal rates of return) or non-pecuniary ones (willingness to sacrifice returns to address various firm externalities)? To answer this question, we categorize the literature into seven tests: (1) costs of capital, (2) performance of portfolios, (3) ownership by types of institutions, (4) surveys and experiments, (5) managerial motives, (6) shareholder proposals, and (7) firm inclusion in responsibility indices. These tests and the most recent proposals data predominantly indicate that shareholders are driven by non-pecuniary motives. To stimulate further research on welfare implications for global warming, we assess whether estimates of the returns shareholders are willing to sacrifice (or, ‘greeniums’), along with the increasing amounts of assets pledged to firms that become sustainable, are consistent with the growth of aggregate investments in the decarbonization sector.

WORKING PAPERS **The Cost of Climate Policy to Capital: Evidence from Renewable Portfolio Standards**  
with Harrison Hong and Jeffrey Kubik

Many US states have set ambitious renewable portfolio standards (RPS) that require utilities to switch from fossil fuels toward renewables. Implementation of RPS increases the bond yield spreads and renewables capacity of investor-owned utilities compared to municipal producers who are exempt from this climate policy. No such effects occur in states without exemptions. Contrary to financial regulatory concerns, the hit to yield spreads, while significant, is far from a stranded-asset scenario. We use our findings to calibrate an integrated assessment model of how RPS, also adopted in other major polluting countries, will impact the cost of capital for the power sector in the long run. The impact of this climate policy on yield spreads can be substantial absent the risk-mitigation benefits of decarbonization for the economy.

**‘Did You Catch the Game Last Night?’ Peer Group Effects in Sell-Side Analyst Forecasts** with Lukas F. Fischer

In this paper, we identify a source of peer group influence that is plausibly orthogonal to information provision, yet nonetheless affects economic decision-making: the shock to an equity analyst of their undergraduate college football team winning the NCAA Championship Game. We find that analysts’ forecasts respond positively to their undergraduate school’s football team winning the NCAA final. We then show that the shock of ‘winning’ spreads within an analyst’s brokerage, positively influencing the forecasts of their colleagues. Brokerages where the degree of this diffusion is greater have lower female representation in their analyst teams, as well as lower ESG scores.

WIP **Doing well by doing... good? The impact of the Equator Principles on PM 2.5 emissions**  
with Ricardo Pommer

Do corporate social responsibility initiatives designed to limit environmental damage actually reduce that damage? Using the setting of the ‘Equator Principles’, a major industry-led project for setting environmental standards in project financing, we attempt to answer this question. By constructing a novel database of geo-located construction projects in the United States between 1995 and 2020, we test whether the adoption of the ‘Equator Principles’ had a meaningful impact on PM 2.5 emissions (a key pollution measure related to human health) during construction. (Results to come soon)

## Research

---

### **Job Market Paper:** *Sudden Stops with Heterogeneous Agents*

This paper develops a heterogeneous agent model of a small open economy and studies how households differ in their responses to aggregate productivity and interest rate shocks. Poor households display stronger consumption responses to aggregate productivity shocks because they are more likely to be constrained in liquid assets. In contrast, rich households display stronger consumption responses to interest rate shocks because they are more likely to be unconstrained in liquid assets. When the economy experiences a sudden stop, defined as contractionary shocks to productivity and the interest rate, the interest rate effect neutralizes the productivity effect. As a consequence, the sudden stop generates consumption-income elasticities that display little variation along the income distribution, similar to a permanent shock. My finding captures the observed behavior of households in the Mexican Peso Crisis of 1994.

### *The Pure Effects of Household Heterogeneity*

Heterogeneous agent models typically introduce idiosyncratic income risk, financial frictions, and recalibrate the impatience of households. I study the effect of each term. Idiosyncratic income risk has no significant effect on the aggregate dynamics of the model. Heterogeneity and financial frictions generate empirically

realistic marginal propensities to consume, but fail to significantly change the aggregate responses of consumption. Decreasing the impatience of households is necessary to generate significantly stronger aggregate consumption responses relative to a representative agent model.

### *Income Risk in Emerging Markets*

I introduce idiosyncratic income risk into a small open economy model that features an occasionally binding income constraint. Income risk generates poor households that borrow up to the constraint to smooth over their low income state. This differs from representative agent models that require a depressed aggregate state for the representative household to interact with the constraint. As a consequence, the model displays a higher average marginal propensity to consume and volatility of aggregate consumption. The improvements disappear when the collateral constraint is removed from the model. The model with income risk fails to generate sudden stops. This occurs as the income shock generates rich households that are able to consumption smooth throughout crises.

### *Borrowing Constraints and Output Volatility*

I study a small open economy that experiences stochastic volatility in its output endowment and is subject to a collateral constraint. I show that an increase in volatility induces a substantial precautionary savings response by households. Stochastic volatility increases the frequency of crises in a decentralized economy that overborrows due to a pecuniary externality. A socially optimal economy that lacks an externality does not experience an increase in crises.
