House for Two : Empowering Women with Property Rights (JMP)

Abstract: Despite global efforts to advance gender parity in property ownership, evidence on the impact of these initiatives remains mixed. One potential reason is the failure to differentiate between documented ownership and effective ownership, which encompasses documented rights and social recognition of the rights. This study examines the gap between documented and effective property rights by randomizing a household-level awareness campaign in a setting where, despite women holding documented ownership, their effective rights remain weak, and beliefs about these rights varies within couples, with husbands and wives holding different initial beliefs. The intervention involves providing both spouses in the treatment group with information about women's property rights alongside a physical copy of the ownership document. I assess how strengthening women's effective rights influences their empowerment by analyzing its impact on gendered resource allocation within households and domestic violence. The findings show that the campaign significantly improved perceptions of women's ownership, leading to increased expenditure on women-specific goods, such as clothing, and reduced men's alcohol consumption. However, there is no overall effect on domestic violence. To explore how pre-existing differences in spousal beliefs mediate the intervention's effects, I develop and test an intra-household bargaining model, finding that the strongest impacts on consumption occur in households with the lowest initial beliefs about women's ownership, while domestic violence improves in households where the husband's initial beliefs are lower than the wife's.

How do political connections affect property tax compliance?

with Aneesha Parvathaneni

Abstract: How does being connected to a local elected leader affect property tax compliance? Using a close election difference-in-discontinuities design, we quantify the effect of being connected to a local elected leader on tax liability and compliance. We use novel administrative data on property taxation from an Indian district and find that citizens connected to local elected leaders are 45 percentage points more likely to remit taxes and remit 351% more in taxes. We also find that these results are partially driven by enforcement as those who are connected are 30.8 percentage points more likely to face fines and face 247% more in fines. Among those who are connected to the local elected leader, we find that these results are driven by poorer property owners.
